1. Audio mod

Yahoo group: pfr3_group
Date: 2008-06-20 22:38:07 UTC
From: w2bpi
Topic: 1 Message: 1

I am rather hard of hearing and needed more audio output. So I added a 10uf 25V electrolytic cap. between pins 1&8 on the LM386. Attach the + side to pin 1. I posted some photo's in the photo section. Building this rig was fun. The manual still has a few errors. There is a errata for some of them on Doug's site. I have had many qso"s with this rig on all 3 bands. The Blt tuner works as good as any Blt I have owned. It will not match everything but is very helpful. Thank you for creating this site. 73 George/W2BPI

2. Tuner mod, and firmware update from KD1JV

Yahoo group: pfr3_group
Date: 2008-06-20 23:30:02 UTC
From: Bruce Beford
Topic: 2 Message: 2

The following was posted to the qrp-l e-list today:

I finally was able to put up a ladder line feed "44" the other day
and try it out with the BLT in the PFR-3. Seems there is a problem.
Turns out there is too much inductance on the BLT toriod to be able
to tune 30 and 20 meters with it.

The fix is to remove a total of 4 turns from the primary winding (the
winding which connects to the "TUNE" capacitor) e.i., 2 turns each
side of the center tap. To keep the secondary turns ratio about the
same, remove 2 turns from the each the HI-Z and LOW-Z windings (1
turn on each side of the center tap) If you want to use the BLT to
tune a near 50 ohm coax feed antenna or short wire, you might want
even less turns on the LOW-Z winding, say just 2 turns, 1 on either
side of the center tap.

Also, adjust the two trimmer caps on the bottom of the TUNE cap to
maximum (fully meshed) and keep the windings on the toriod compressed
fairly close to each other instead of spread out over the core, other
wise, you might not be able to now use it on 40 meters.

With these changes I can now match the "44" on 40/30 and 20. Finding
the match is still not easy. The tuning is very sharp and you have to
make the adustments very slowly. I found that after you get the LED
to start to dim, you actually have to make it brighter again with the
TUNE control before the LOAD control will make it go out altogether.

One other issue. The firmware sent with the first 100 kits has a few
minor bugs in it. The most serious being a sluggish response to the
paddle, especially at the higher code speeds. This also affects
straight key mode, making an external keyer not work properly either.

This problem has been fixed along with a little problem with Iambic B
mode which tended to add an extra element if you wanted it or not. In
addition, I added a few new features like a TUNE mode so you can
generate a steady carrier if you use an autotuner and the rig now
remembers your last used frequency so you return to where you were
after changing bands instead of loading the default power up
frequency. (This could be handy if your bouncing between bands in a
contest, This only works as long as the rig is on). Finally, when you
go into DFE mode, the display now shows [- - -. -] instead of
blanking, so you know your in DFE mode and the rig didn't just go
to sleep.

If you just recently bought a PFR-3, then you probibly have the new
firmware. The MEGA48 will have a red dot on it if it is. Otherwise, I
would suggest you send the MEGA48 chip back to me for reprogramming.

Be sure to send it in a way the pins don't get crushed in the mail. (small padded envelope or box) If you don't have a piece of black anti-static foam to put the chip on, cut a few strips of cardboard to slide bewteen the pins and wrap it in tin foil.

A return label and postage would be appreciated, but not required. I will try to return the chip as soon as possible. Send it to me at

Steven Weber
633 Champlain St
Berlin, NH 03570

Sorry for this incovenience.

From: Paul Smith
Topic: 4 Message: 4

Hello guys and tnx for putting up a yahoo group for this radio.
I have built some SW kits and tuners and such but never anything like this. I don't think the MEGA 48 chip in my rig has the red spot on it. by the # 1 pin notch there is a tiny triangle. Is that the mark or does my chip need to go for re-programming? I have completed Group 1 and smoke test and Group 2 smoke test worked and I have a receiver that hears 40 meters. On to the next step.
Thanks
Paul N0NBD

From: kg6hdh
Topic: 7 Message: 7

Hello,

I am new to the group. I have finished my PFR3, and everything seems to be OK except I don't have enough RX peak range to peak both 20 and 40M well. Anyone else have this problem, or have a solution.

Fun little kit,

Morris
AD6ZH

Actually, my RF peak seems to do nothing at all. I can turn that knob
all day long and not notice a single bit of difference on any band.
The only thing is I have not yet had a chance to dig into that much,
too much other stuff (like work) getting in front of my play time.

And yes, it IS a fun little kit!

11. PFR3 Comments & a Question

Yahoo group: pfr3_group
Date: 2008-06-22 20:32:41 UTC
From: Cal Cotner
Topic: 11 Message: 11

Hi all,
I acquired an assembled PFR3, and have just been playing with it a bit. No qsos yet. I'm not sure at this point how well I like the li'l rig. The pushbutton tuning doesn't faze me as I
also have a Cubic/Swan Astro 150 which uses pushbuttons on its microphone for tuning. Otherwise, I'm still getting used to the PFR3. The receiver audio output seems a bit low. Does anyone have any comment on the paddle kit, e.g., does it have a good feel (I know that's subjective)?
Anyway, I'm glad there's a group for us PFR3 owners.
72/73,
Cal K4JSI

13. PFR3 Comments & a Question

Yahoo group: pfr3_group
Date: 2008-06-22 21:53:54 UTC
From: Ken Evans
Topic: 11 Message: 13

All,

I have had the PFR3 on the air since June 15. I bought it at Dayton and built it when I came home. The RX audio needs to be a mid range or higher on mine, but I don't know if that is due to my ear buds - I have yet to try different headphones. I get a distinctive peak when adjusting "RX Peak" on all three bands, but I adjust that after I have peaked the "tune" and "load" caps for max signal or noise on the BLT. I have used it successfully on a W3EDP, 40 meter and 80 meter half waves fed with ladder line. I will try a 44 foot center fed soon to see if I need to make the mod suggested by Steve Weber.

As for the paddle. I have it and although I would like to have the ability to narrow the gap, I find it very useable and am glad I have it. Last week was spent in San Antonio welcoming a new grandson. I used the PFR3 with "AA" batteries to a W3EDP, and worked three continents and a number of states on all three bands.

So far, I am pleased with the functionality. It isn't a K2 and the paddle isn't a Bengali, but for the money, it performs well. I will post results after I try the 44 foot center fed.

Hi George,
Is it a change specified to the ladder line feed "44" you put up.
Or in other words shall the change be made generally to cope better now with the most feed conditions?

Please what does "44" - written this way - mean?

I do not have or know anything about the"44" antenna. I have used the modified version with a carolina windom, a longwire ant. (130' long), and a no counterpoise antenna. So I guess I can't say if this mod is for everybody. In my case I could not load on all three bands before the mods. You might want to talk to Steve Weber. He designed the PFR3 and suggested the Mods. Have a good day. George/W2BPI

This is just a guess, but the late L. B. Cebik - W4RNL did some antenna modeling for what might be the best all-around multi-band antenna. It was a dipole "44" feet (I believe) on each side (88 feet overall). The antenna was to be fed with open wire or the like and an antenna matcher. I think he did this under the heading "if you could have only one antenna, what would it be?"
Hope this helps.

From: KI6DS
Topic: 22 Message: 22

Effective immediately:

Hendricks QRP Kits Warranty Policy

Hendricks QRP Kits strives to offer the best quality, affordable, kits available in today's market and make your kit project a complete success. We have confidence in the quality of our designs and in the performance of our components. In keeping with this tradition, we will replace any electronic component, for the life of the product, for any reason. If you lose, damage, burn out, or install a component in error, that requires a replacement, simply contact us, pay the postage or shipping, and we will replace it. This is in addition to our previous practice of replacing any component missing from our kits, shipped first class mail, free.

This guarantee does not cover case parts.

To our knowledge, no amateur radio company offers this comprehensive policy.

Doug Hendricks

This kind of sounds like the NorCal Doublet. I think this antenna was the inspiration for the BLT tuner.

27. Re: [pfr3_group] BLT MODS for PFR3

Yahoo group: pfr3_group
Date: 2008-06-25 11:08:04 UTC
From: Dieter Klaschka
Topic: 15 Message: 27

Hello, Fred and the group,
Thanks for the info and this addendum.
At home I use my 2x20.5 m dipole plus 20m feeder plus 6:1 balun plus a short length of RG58 together with an internal tuner of an FT890 which even tunes all to 160m.
With the K1 I use the ZM2 atu to the feeder without the balun/coax.

I have got no experience with the BLT but before modifying it I would try to lengthen the feeder a wee bit and see what will happen.

For portable use there will be much shorter feeders on a- let's say - 10m pole or kind of lw or w3edp...
So I am really interested in the experience of the other kit builders on that mentioned mod for the BLT before housing it in the 'Yellow Box'.

Per the original instructions, the BLT in my PFR3 would not tune on 20m and it was difficult on 30m. I did the mod and now i can match all 3 bands.

If someone has already built their PFR3 and it works ok, there may be no need to do the mod! But since trouble has been experienced for a short antenna by KD1JV, and a long antenna by myself on 20m -- you might need it.

My antenna is much much longer than the 44 foot (approx 13.5 m) center fed doublet ... so its actually more a matter of having too much inductance for 14 MHz operation.

i was able to mod my unit without unsoldering all the wires between the board and the case -- your mileage may vary! and i needed to take out the board also to confirm I had the original firmware -- so i'll be sending my chip to Steve sometime after field day.

Hi,
Just an idea. Perhaps I will decide to build an extra BLT ugly construction first and have some experiments with .
There is an article (mods by KX0R) together with the W6JJZ BLT instruction which encourages to experiment due to personal antenna situation and configuration.
So it could make a difference indeed using a 2x 6.50 m centre fed at
12 m height during FD or a 2x 20.5 m at 15m with a length of 20m feeder. Then there will be the need for a mod.

Dieter

certainly if you have the large torroid and 2 variable caps you could build a homebrew BLT to check this out, but it may not be necessary. i believe best success is to change the BLT torroid to have fewer turns -- it should still work on 40m, and this rig does not cover 80m.

if your PFR3 is already built, i am suspicious you might run into difficulty tuning its BLT on 20m with any 'reasonable sized' antenna. KD1JV had problems with a doublet slightly larger than a half-wavelength on 20m, and I had difficulty with a much longer antenna. when i reduced the numbers of turns, my BLT is working well on 20m.

if your PFR3 is not yet built, it would not be hard to check out the original and modified versions BEFORE mounting the board in the case with your antenna(s).

i am puzzled why this BLT mod has not been reported earlier, as I would think they would be used on 20m!

Curt, Thanks for the answer.-
I read the encouragements to modify the BLT on the BLT manual page.
There are a lot of reasonable hints for modifications due to band and antennas.

My PFR has not arrived yet. So I am going to order some different cores
and try to simulate a FieldDay configuration with my 12 m pole, 2x7.50m dipole plus chicken ladder and the same length as an up'n outer vertical... let's see how this will behave on 40,30,20 then.
I will use an MFJ anylyzer)
There is no real need to use the PFR as home station with my 41m centre fed dipole.
This weekend I will have a test whether a ZM2 will match this dipole for 50 MHz (I built a kit recently BODAN 6) , I can receive Es stations from the East and EA...
Have a nice day.

32. Winding Toroids

Yahoo group: pfr3_group
Date: 2008-06-28 15:33:58 UTC
From: n3ham1
Topic: 32 Message: 32

Newly retired and getting more involved with qrp, so I'm in the process of building a PFR3. So far the rcvr is working and I should have it completed by next week. Since this is my first serious build, I knew I was going to mess up the toroid winding, not having done one before,and having bad eyesight and no patience. So I enlisted the aid of Mychael Morohovich AA3WF...aka...the Toroidguy. He did a terrific job and greatly increased the odds of getting mine on the air. I have no financial stake in this, but I recommend him. Have a fine
FD. 73,Jerry N3ham

Topic: 32 Message: 33

Hi, Jerry and the group,
Whether you will wind the toroids yourself or not, reading these lines will be helpful anyway
http://www.qsl.net/ve3mcf/elecraft_reflect/Torroid_Winding.txt

Jerry, w h a t do you think is difficult when winding a toroid besides your eye sight of course?

When my PFR3 will arrive:
I will take all parts and stitch them into the copied parts list on a foam board, put all this then in a large shoe box for safety - all is at one place now and will smooth xyl.

I measure Rs and Cs before they will go onto the board
I have got a ruler with inches on my bench (the "bench " is the writing table in the former childrens' room, a simple board ca 1' x 2' (you see: when in Rome do as the Romans do ;-)
with a wooden frame, small copper board (3" by 3") with a 1 Meg Resistor to central heating, for anti statics)
There on the wooden frame I have got penciled the ruler with a fine liner

I use a Third Hand device and a tuna tin (rectangular)box to put the board on and put the cut leg rests of Rs & Cs etc in so none will stay as a rest at the table
I will copy the circuitry and the main scheme
I will draw some squares with a pencil on the drawing where the single components go and mark the squares x axis:A-B-C-D ..., y axis 1-2-3-
it's easy now for making notes to find e.g. "C32 in A4", saves time later, I always make small notes at the margin of the manual

I color all parts in the sketch which I have already mounted.
I use a hot iron ca 400C, thin solder,
I clean the tip very often and also use a metal sponge(household ware) stored in a tin

When building I will try to do it in a couple of sessions - too long a break makes it only extra difficult to start again
(at the moment the gardener fights with the ham , so there might be some delays, hi)
Since I have finished some kits toroid winding won't be the problem, correctness and attentive, repeated control of each single step within the building process is important (count twice, look twice, measure twice...compare twice...I promise that I have the band of the diode in the wrong position.... Even xyl could have a look at the board after a soldering process.

I use only daylight for work plus a magnifying glass to control each solder spot immediately; I don't put in groups of parts which shall be soldered afterwards.
I will always stick to the steps given in the manual since I am no real constructor.
...
Just to contribute to the group.
Any addendums and especially comments on single steps during mounting and soldering and

aligning the PFR3 would be appreciated to avoid mistakes..?
(Sry for the command of my language concerning my stock of technical expressions)

Well, you see I am looking forward very eagerly to get the kit.

34. PFR3 Finished

From: W2AGN
Topic: 34 Message: 34

Thanks to Steve for getting the chip back to me so fast! I put the finishing touches on the PFR-3, and built the paddle today. Made a few FD QSOs just to try it out, using internal Alkaline cells. I see BJ's wholesale has AA Lithium on sale now, so will pick up a pack of those for serious portable ops.

I like the paddle. I find it MUCH better than the Elecraft paddle they have for the KX-1. This one seems sturdier, also.

At !/2 the price of the KX-1, the PFR-3 should be a serious contender.

35. PFR amd FD

Yahoo group: pfr3_group
Date: 2008-06-29 20:55:50 UTC
From: Paul Smith
Topic: 35 Message: 35

I worked a few stations from the side yard on my PFR-3. Sure did work good and is a joy to use. Now that FD is done I will take it back apart and send the chip ti Steve KD1JV for re-programming and I may do the audio mod as it looks simple. My ears could use a little help.Lots of fun! de Paul N0NBD

41. Spectrogram - alignment?

Yahoo group: pfr3_group
Date: 2008-06-30 13:26:59 UTC
From: g0azs
Topic: 41 Message: 41

Hello

Just reading through the manual thoroughly prior to starting my PFR-3 build tomorrow.

I was just looking at the procedure for reference frequency calibration and then IF offset adjustment and BFO trimmer adjustment.

I have spectrogram on the PC and of course another receiver. I assume it would be easy enough to calibrate the frequency by looking for 10MHz on the receiver with a short lead near TP1... am I right?

...and I can also see it would be easy to use Spectrogram for the BFO trimmer adjustment.

But... how about the IF Offset adjustment... would Spectrogram be OK to do that too? Or should I leave it alone?

If anyone has done these adjustments I would be grateful to hear your experiences. Or maybe you didn't need to bother adjusting any/some of them??

I'm still relatively green building kits so I learn more as each one gets built. The use of Spectrogram is new territory for me :-)

Marc,

Check out my calibration procedure for the ATS rigs at the website below for ideas on how to align. Similiar enough rig (same designer!) that the idea is transferable.

Topic: 41 Message: 43

Mark

you get a gold star, or recognition as having a different kit building attitude than most of us - in reading so far ahead.

for mine i merely did the listening test, which involved tuning and matching the pitches. no i cannot play a violin - it wasnt that hard. when calling others they come back so likely i have it close enough. out of the box the cal accuracy is well within the 200 hertz described.

yes you can sniff like that to measure frequencies (and see if oscillators are working). if you are interested, try measuring frequencies with spectrogram - but at audio frequencies a wire won't work as well unattached. for this you could connect the soundcard to the headphone connector -- just verify that no DC voltage is present before you make the connection.

concentrate on getting the parts in the correct locations, making good solder joints and not missing solder joints - and things should go well enough. do the intermediate check-outs and that will boost your confidence. enjoy the journey building the rig.

73, curt

48. PFR-3 used for Field Day solar contacts

Yahoo group: pfr3_group
Date: 2008-07-03 04:04:13 UTC
From: dan_utroske
Topic: 48 Message: 48

I picked up the PFR-3 at Dayton and had it together in about 10 evenings. I took it to field day to show it off to a few friends. When we got around to setting up for our solar bonus points near the end on Sunday we found the battery dead. I made a voltage measurement on the solar panel and offered to connect the PFR-3 to the panel, with the voltage reduced by the charging battery, and our 80M loop to see if we could make the required contacts. A couple of us ended up making 9 contacts in a short time. I used an LDG Z100Pro tuner between the radio and the loop. This little performance may have made a couple of QRP converts that day, as well.

George,
I can't answer that because I just signed up to the list.
The only thing I noticed on my other rigs is that weak CW sounds a bit fuzzy
under thes low cycle conditions.
BTW,
How long does it take the average builder to put one of these together?
I'm thinking of getting a money order out tomorrow.
Bob

54. Parts Clarification Needed...

Yahoo group: pfr3_group
Date: 2008-07-05 19:28:34 UTC
From: Craig LaBarge
Topic: 54 Message: 54

I'm in the process of building a PFR3. The Section 2 instructions describe C8, C9, C10 and C79 as "150pF (151) NPO, Disk Brown." The parts inventory list doesn't include these. What is listed (and provided) are "150pF (C0G) Mono Yellow."

Just double-checking... Are the 150pF mono (yellow) caps the right parts for C8, C9, C10 and C79?

Thanks.

73, Craig WB3GCK

55. Re: [pfr3_group] Parts Clarification Needed...

Yahoo group: pfr3_group
Date: 2008-07-05 22:10:26 UTC
From: Ed - K9EW
Topic: 54 Message: 55

Hi Craig,

I got one of the first 50 kits at Dayton, and here is a list of the discrepancies I found. I'm sure some - if not all - of these have been corrected in later revisions of the manual. Check on Doug's website for the latest release. The answer to your specific question is, "Yes" (see "GROUP 2 ASSEMBLY" below).

73,
ed - k9ew
www.k9ew.us

GROUP 1 ASSEMBLY

1) C48 should be a 0.01mfd (103) mono/yellow capacitor, not a 0.1mfd (104) mono/yellow.

GROUP 1 SMOKE TEST

1) In the Group 1 Smoke Test, the display only spent about 1/2 second on the 8's, and 1/2 second on the band; not 2 seconds on each as

described in the manual. I contacted Steve Weber about this, and he said he changed the timing because 2 seconds seemed too long. I suggested that 1/2 second was too short, and that 1 second would be about right.

GROUP 2 ASSEMBLY

1) R14 (1M resistor) was missing.

2) C7, C11, C13, C14 are 100pf (103) C0G's (mono/yellow), not NPO's (disk/brown) capacitors.
3) C8, C9, C10, C79 are 150pf (151) C0G's (mono/yellow), not NPO's (disk/brown, with black dot) capacitors.

GROUP 3 ASSEMBLY
1) C55 is shown, but not listed for assembly. Install C55 (0.1mf, 104, mono, yellow).
2) C59 should be a 0.001mf (102, disk, brown).

GROUP 4 ASSEMBLY
1) C76 (0.01mf, 103, mono, yellow) was missing from the kit.
2) S5 and S6 mount on TOP of the PC board. This is obvious, except that it was listed along with the coils that are mounted on the BOTTOM. And of course, I got caught up in the excitement, and had to unsolder and re-install them on top.

GROUP 5 ASSEMBLY
1) The switch terminals referred to in the last step ("snip the leads") is S9.

I think that's it. And as I said earlier, most of these errors have
been corrected in the updated version of the manual.

If you have any questions, please don't hesitate to drop me a line.

Hi Dieter

FWIW... I don't know if something has changed in the kits, but when I was doing my group 2 tests last night, there was so much audio, it would have caused pain when wound right up. You may not need to do the mod... check first.

Likely it's for the BFO and doesn't need grounding like the filter crystals.

Marc:

I just finished the Group 2 testing. I also had some strangeness with the paddles. It seemed that after I completed the calibration steps, the rig stopped recognizing the paddle input.

Eventually, the paddles started working again. I ran through the calibration steps and, after I pressed the KEYER button to exit the calibration mode, the same thing happened. (I'm using the chip with the old firmware, by the way.)

Other than that, the paddles seem to be working normally (when they worked!). :-)

I'm hoping they start working again, so I can continue on to Group 3 this afternoon.

I can answer the dumb question, I couldn't get the knob on with the star washer on the top so I figured it went on the bottom right on top of the cap. I held a small piece of wire down into the screw hole of the cap and slid the washer over the wire. I gently took the wire away and carefully with the screw already in the extension, placed it over the washer and cap, screwing it in. Worked like a charm the first time. I used the dished end of the extension for the screw head end. I've made a few qsos so far on 40mtrs with a coax fed dipole, so I haven't tried the BLT yet. Love this radio, the HW9 gets a rest. 72, Jerry N3ham

From: Craig LaBarge
Topic: 58 Message: 63

Just a follow-up... I went back downstairs and the paddles eventually started working again. I changed the keyer mode from iambic A to B and they stopped working again. I double-checked continuity from the paddles right up to the pins on the chip, so it doesn't appear to be a construction problem. Something must have gone whacky in the firmware, I guess.

Hi... Yes it's a new one...see this from a mail to me from Steve a week or two ago...

"...If the MEGA48 chip has a red or yellow dot on it, then it is the new one..."

I guess a low voltage might cause the erratic paddle behaviour? Maybe I'll try a higher voltage next. I wonder what voltage Craig was using?

Put it on the charger last night. Got up this morning to a bad odor comming from the basement. Thought I had a sewage problem. In looking around I discovered my gel cell battery had the sides and top bulged out and it was very hot. That is where odor was comming from. Now I wonder if something was wrong with the battery or did the charger malfunction and over charge the battery? Could have started a fire! Wonder if anyone else has had this experience? welcome to the crowd. well since you have already ordered, you better hope so! i dont operate portable that much, so spending the extra $$ on the KX1 wasn't a priority (i spent these $$ on the KAT100 !).

the receiver should be similar, as both use similar chips. the Rx sounds great to me - let's see later how the performance numbers compare. i have no concerns here.

transmitter - well its got filters and outputs around 5 watts. testing should confirm its a clean design (if we put the right number of turns on the toroids and proper caps in place -- and likely our power output results confirm this).

where they are different is the man-machine interface and the package. using a radio without a tuning knob is ok on CW. RIT is easy and so is changing sending speed.

i haven't done the work to figure out how to use the internal batteries, as removing 4 screws seems a bit much to use this feature.

my chips been sent back to Steve (i had one of the first 100 ...) and waiting for Doug to send 6 caps that were missing (maybe in today's mail ...).

i need to assemble my portable antenna so i'll have an excuse to take the rig places!

Enjoy the new rig when it arrives. Patiently read the instructions, and some steps require some thought. Rig indeed is nice.

Yes you can feed your center fed doublet with twin lead, certainly at 5 watts it should do fine for a reasonable distance. A popular choice to consider for this tri-bander is a 44 foot (13.4 m) total length fed in the center -- this should still have a nice pattern on 20m and be enough to work on 40m. (please note info on using less turns on the antenna tuner transformer than the instructions -- info should be on this list somewhere).

78. Audio Mod...Problem

Yahoo group: pfr3_group
Date: 2008-07-11 01:37:45 UTC
From: n3ham1
Topic: 78 Message: 78

The rig has been a lot of fun so far..at home. I haven't taken it outside yet. I think at some point I'm going to send the chip in to get it updated since there are some keyer issues that crop up now and then, unless it's just me trying to adjust to the paddles. I tried doing the audio mod but it won't work for me since there is a local daylight AM broadcaster not far from here that comes booming in along with the improved volume. Without the mod,there is adequate volume on 40...30 and 20 could use a bit more. Jerry.

Hi Jerry,

You might try a high pass filter between the ant and the
lpf.

The one in the Rock Mite files is a good one and may do the
job for you.
http://f1.grp.yahoofs.com/v1/oL52SJ1p7yprUwR-ckFpydsd76pp0UbylsPYasvKDfM8Wp7dAyLLquNW8uY4E
2dorgLS0mYEcQFlUzccfCk0YyzVFw/BCI%20filter/RM%20BCI%20Schematic.jpg

Its a 5 element Chebychev and is the #61 filter in the 1993
handbook filter table. The table lists 40dB rejection at
1.56 Mc.

I love this radio stuff !

Thanks Curt,

Yeah, the BLT mod, message #2 and etc... It be great to use it with only one antenna for 20 and 40. Does the 44 feet works on 30m?

I'll check the manual on reception and will probably do the mod at first. Then, we'll see.

Expecting some good outdoor fun with the yellow box!

From: Paul Smith
Topic: 85 Message: 85

My chip came in the mail a few minutes ago. I put the yellow radio back together and ZOWEE!!!!! It is beautiful!!!!!!!!!!!!!!. I have been having withdrawl since a week ago last Thursday when I sent the chip off. The ole USPS is slow from Kansas to New Hampshire. Actually I think you can't get there from here you have to go somewhere else to start out hi hi.... Thanks Steve for your work and Doug for all that you do... Man I am pumped. It is raining today so no working from the town square as I had planned for the first outing but I will work someone from home de Paul N0NBD.

PS the chip now has a yellow dot on it.... Man I like YELLOW.....

The kit just arrived and i've printed out the 24 page manual
now the fun begins. 73

87. Looking for a signal from the DDS and substitute parts for BS170 finals

Yahoo group: pfr3_group
Date: 2008-07-13 18:18:01 UTC
From: querencias
Topic: 87 Message: 87

Bought a partially finished PFR-3 from a friend who is having problems with his eye-sight. He had finished the receiver section and did a good job. However, I suspicion that I blew the "finals," the 3 BS170 MOSFETs, as I finished the assembly. Looking on the internet there was no substitute. But looking in the Mouser catalog they found a match, 2N7000.

http://www.mouser.com/Search/Refine.aspx?
FS=TRUE&Ntt=*bs170*&N=1323038&Ntx=mode%2bmatchall&Ns=P_SField&OriginalKeyw
ord=bs170&Ntk=Mouser_Wildcards

Anyone on the list have any suggestions or experience with this problem?

I checked all the other circuitry associated with these MOSFETs and everything seems ok, as best I can tell without an oscilloscope or logic probe.

So in summary everything seems ok, in particular I checked the FQP7P06 which switches the V+ to the BS170s and all the signals seem ok. The critical signal I can't check without the scope/probe is the "BIGNB" (pin 16 U7) which drives the dual NOR gates that in turn drive the BS170s.

Anyone know how to check the 7 MHz signal on that pin without the scope?

72/73 Grant KT6L

HI Grant,

Try using a small cap, say ~ .001 uf or less clipped to a jumper to act an antenna. Touch the cap to pin 16 U7 and listen to the PFR freq (7040?) on another receiver. Should be able to hear it. may have to string the "jumper antenna" close to the antenna terminals of the receiver.

The 2N7000's will sub for the BS170's, except the 170's are more robust, and will handle about twice to power dissipation. Be careful tho, the drain and source leads are reversed, so the 7000's arent a drop in replacement. I'd order the BS 170's, rather than using the 2N7000's in this case, since its a little tougher final, which is a help during tuning.

Mouser has them on this page.
http://www.mouser.com/Search/Refine.aspx?Ntt=*bs170*&N=1323038&Ntx=mode%2bmatchall&Ns=P_SField&OriginalKeyword=bs170&Ntk=Mouser_Wildcards

Good luck, and let us know how it goes.

I love this radio stuff !

Terry,

Very clever! This test shows that the DDS is generating the signal input to the NOR gates but the gate outputs are VERY low, per the volume on the aux receiver - have to conclude that
the MOSFETs are now dead...looks like the gates are going straight to ground. I have a lot of confidence that the 10 V swx is working as I see the voltage on the MOSFET source pins. Also found a reference to a replacement on the net - NTE claims that NTE490 will sub for the BS170 - haven't checked the specs yet but they're probably available at Fry's.

Thanks for the clever and elegant test - that's REAL Ham radio!

Congrats, sounds like you have figured out. Wish there were
a Fry's near to me. I've only been in the one in Phoenix,
but it sure beat our local Radio Shack for parts (and
everything else).

Good luck and hope swapping the finals does the job.

I love this radio stuff !

Terry,

Very clever! This test shows that the DDS is generating the
signal input to the NOR gates
but the gate outputs are VERY low, per the volume on the aux
receiver - have to conclude
that
the MOSFETs are now dead...looks like the gates are going
straight to ground. I have a lot
of confidence that the 10 V swx is working as I see the
voltage on the MOSFET source
pins. Also found a reference to a replacement on the net -
NTE claims that NTE490 will
sub for the BS170 - haven't checked the specs yet but
they're probably available at Fry's.

Thanks for the clever and elegant test - that's REAL Ham
radio!

91. 40 meters sounds great!

Yahoo group: pfr3_group
Date: 2008-07-13 20:47:15 UTC
From: Joseph A. Feustle, Jr
Topic: 91 Message: 91

Just finished the receiver section and am slowly moving to the transmitter. I've had the kit for a while but waited on assembly until I got my new Hakko 936 soldering station. Sure worth the wait! Tuning up and down seems a bit strange though I'm certain I'll get used to it.

92. PFR3 Portable "Shakedown Cruise" 07-11-08

Yahoo group: pfr3_group
Date: 2008-07-14 13:32:09 UTC
From: donaldjmcbride
Topic: 92 Message: 92

Hello Group,

Just finished building the new PFR-3 Xcvr and took it to a 1600' ASL bluff in Cook Forest State Park in rural PA on July 11th for a "shake down cruise" of sorts. Will try to upload a photo of setup and the view from there.

Those looking for a poor man's KX1 might take a look at this new offering by Doug Hendricks. It's another one of Steve Weber's excellent designs and is a self-contained portable 20-30-40 meter transceiver with built-in memory keyer, BLT tuner and AA batteries. I haven't done the recommended firmware update yet, but the rig and keyer seem to work fine as is. I wonder what difference others are seeing with the updated chip?
I also haven't yet done the internal BLT mod so my tuner doesn't tune much. I was far too anxious to try the new little rig out!

Anyhow, it was fun getting 589/599 signal reports on my inverted jumper-vee launched into a tree with a drilled golf ball. Being 250' above average terrain really seems to help!
Tuning with buttons instead of an analog dial takes a bit of getting used to, but does work. My Wilderness Radio SIERRA seems easier to use but I guess we need to get with the times.

Very interested to hear how others are doing with the PER3 and how it compares to the KX1.
... 72/73

I am not sure what all the up graded chip does. My acted kinda
sluggesh at 25 wpm but fine at 18. The upgraded chip that I received in
the mail Saturday has a pretty yellow dot on it. It does remember the
last frequency that U were on. Maybe Steve can give a rundown of the
changes. I know I like mine fine. de Paul N0NBD

Well group 2 is complete .. listened to w1aw on 14.0475mhz and the receiver sounds great. Well it's on to group 3 Transmitter section.

95. New member and MFJ keyer question

Yahoo group: pfr3_group
Date: 2008-07-15 04:18:06 UTC
From: bosko22666
Topic: 95 Message: 95

Hello, interested in getting one of these as it's backpackable - but I'm new to ham and don't know . dash yet ;~)
Was wondering if a MFJ-464 CW/keyer/reader with a keyboard would work with one of these? I'll learn code when I have the time but would like to get and use one of these MFJ keyers as I can hear what I'm typing and receiving. Will the PFR3 tune well enough so I can get a solid signal and have the MFJ decode it? Thanks in advance!

Tom

tuning of the PFR3 is solid, as with its stable clock the DDS chip drifts less than a conventional VFO.

however, the results with the CW reader will vary widely. it should copy machine sent CW (like ARRL bulletins) well. how well it will copy real world CW is not so certain. CW sent by a human with a paddle may be copied less accurately, and adding interference and noise may degrade things further.

another factor is battery power needed to fun the MFJ-464 (do examine it).

convince yourself that you can do CW. back when there was a novice ticket it was common for elementary school kids to pass the CW and written tests. (of course they may have had more free time than us!). yes CW is the king of modes when it comes to portable operating, DXing and even contesting. i enjoy all the other modes, but taking the time to do CW will enrich your experience. of course if you build a PFR3, you will committed to learning and using CW !

Can I add something

In 15 years, I never heard of a software or machine able to make goo
copy of CW. But, I always heard QSOs at slow speeds, for example
around 7.100. As I am contesting since 2004, I send and copy 30wpm
now but, like almost all hams, I'll always slow down to the other
station speed.

In summary, take your code, you won't regret it! And there will
always be somebody for you to QSO.

Tom
Curt's advice is sound. Learning CW need not be as difficult as some would make it seem or as we would like to convince ourself. There are sites on the web that can help you learn CW by methods that will get you up-and-running in very little time. These methods teach in a way more compatable with how the brain works. I hope you can find a CW mentor in your area who will coach and encourge you. CW is a skill that sets us apart from the crowd. You CAN do it.

From: Bert M. Thompson
Topic: 101 Message: 101

Well my pfr3 is complete, however, can not seem to get the full 5 watts on any band. I checked the turns on L8, L10 and L12 and they are correct. I have 12 volts at the board the best band is 20 meters .. get abt 3 watts the other bands abt 2 watts. I have not checked the turns on L9, L11, and L13 but they appear to be correct also. I would like to get close to the advertised 5 watts on each band before boxing up the board. I also have tried moving the turns around with a little improvement.. BOY I hope I don't have to start removing turns!! Perhaps an other transistor can be paralled with the three??

Bert M. Thompson kb3mhb Thanks for listening 73!

Bert,

Better check those other coils. I had to diddle the turns on mine to REDUCE the power to 5 watts. At 12V I was getting 8 watts on 20M and 7W on 30 and 40. So something is wrong. After keying your rig for 30 seconds or so, check the temperature of the transistors in the final. If they are all about the same temperature, good, but it is possible one is blown and the others are carrying the load.

Thanks to everybody for the input. Guess if I can find he time to build a kit I can make the time to learn CW. Time is what's in short supply, however, as I work a ton of hours and some weekends too. I get my free time in "chunks" - so I figured the keyboard keyer would allow me to hop on every now and then - don't have the 30 min each day to practice code. Well, guess I'll try to MAKE the 30 min . . . .

Thansk again everybody!

There are sites on the web that can help you learn CW by methods that will get you up-and-running in very little time. These methods teach in a way more compatable with how the brain works. I hope you can find a CW mentor in your area who will coach and encourge you. CW is a skill that sets us apart from the crowd. You CAN do it.

Thanks John,

Well all is well; short between the headsets hi. Lots of power; the problem was that I had my MFJ tuner in tune mode for 40 meters and 20 meters for my qrp rigs. Well of course those settings are not the same as those for the "pfr3". Now I have the tuner settings written down for 20, 30, and 40 using my MFJ tuner. Next I'll try to to tune my antenna through the unbalanced coax using the "pfr3" auto tuner. This is not my "DUMBEST" mistake hi. That was in group 3 installing the U8 socket and not the chip. Then checking the outputs for the proper levels. Well it's on to the internal tuner.. if that works I can though away my MFJ tuner. hi hi 73

105. PFR-3 completed/diode question

Yahoo group: pfr3_group
Date: 2008-07-17 00:48:53 UTC
From: boblusby
Topic: 105 Message: 105

Complete my PFR-3 this past weekend and have it on the air.
Substituted two 1N4148 diodes for D1 & D2 which were missing from the original parts. Seems to work okay. I have not installed the internal battery case yet.
Any suggestions for some diodes to drop the supply voltage when using an external 13.5v power supply? The two general purpose diodes (unknown value but had a good voltage drop) I used died after a short period of transmitting. I am running close to 7-watts with 13.5v power supply. Battery pack is just about spot on.
Cheers, Bob, k9foh.

A couple of cheap 1N4001's would do it. They're rated at 50v, 1A
which should do the trick. I've been using them in my PFR3 for
several weeks, and they work fine.

Tom

if it took 30 minutes a day for a year few of us would know CW. learn the characters one by one. and as you see text, exercise your mind by converting letters to sound. when you see a C think 'dah-di-dah-dit, and vice versa. learn these letters a few at a time. when you have about half of them, start listening to CW on your rig. catch the letters you know and let the others fall onto the floor. your confidence will build and you'll get the rest of them down. remember we are interested in this for the long term, don't fret the time you dont have. eventually you'll catch dah dididah which is T U or thank you. listen to those contest exchanges (boring except the thrill of shaking hands by radio with operators world-wide. dididididit dahdit dahdit = 5 N N (which is 5 9 9 signal report). go for it! listen to the music!

Well if it works on 40 and 20, it should on 30. Many portable ops talk as if 44 feet is a mystical number. come to think of it, it is close to a resonant half wave on 30m! its a mere compromise between 40 and 20 that the tuner should relate to, and will produce a dipole-like pattern.

Hi Bob,

I too will be installing diodes to get down to the 12 volts for the
PFR-3 . I am using 3 SK3081's in series . They are silicon diodes. I
plan to install mine inline on my power cord instead of in the rig .
These will provide a drop of about.5 each. I'll report later on today .

From: Bob Lusby
Topic: 105 Message: 111

Thanks for the prompt responses. I used two 1N4001 diodes in series. Put them right at the Power Pole connector with heat shrink. Brings my power to 5-watts. Measured .75-volt drop across each so that gives me about 1.5-volts down from my Astron station power supply. Measured current is right at 500-ma key-down.

Another tip. I mounted a couple of sticky-feet on the rear feet to give me about an inch of tilt for better viewing while operating from the home QTH. Used Poster Putty to hold the feet on and then they can be removed very easily.

Now to find some knurled screws for easy case removal.

Again, thanks for all the quick help.

Cheers, Bob, k9foh (ex: KR6FJ, Okinawa; KA2BL, Japan; KA1DX & KA1BL, Marcus Island; KA1CQ, Iwo Jima; G5EBA, England).

I have not looked yet but I would bet McMasters-Carr would have small knurled screws. A person might have to buy a hundred but I also would bet a person could unload the lot right here. Just sittin here listening to 40 meters and thinking what a "purty" yellow radio... de Paul N0NBD

Paul

Are you married? Reason I ask is that I, too, bought one of those bright yellow puppies. But my XYL doesnt know it yet. The box is still hidden. Afraid to open it. How did you handle the shock your XYL went into when she saw that gosh awful yellow?

Henry,
I have been married 36 years. I don't say anything about her sewing, quilting, beading, painting ect ect and she has not much to say about my radios. You do have a point tho, I have not "paraded" it down stairs for her to see hi hi hi de Paul N0NBD

PS the yellow GROWS on you LOL

Hi,
Fine business Marc!
I had a look at your photo show as well. Great little yellow box. Congrats.
I fetched mine from the customs last Tuesday.
Took me a whole afternoon to drive the 40 miles there, wait and pay the DL VAT finally.
The ladies there had to look for a proper customs declaration number - " gagdet producing tones" ...an electronic piano or so.
Fortunately I had some numbers with me and they were happy to have a choice, hi.
But they looked very, very seriously. What a difficult, important job they've got to do.
Mind!!!

Will start checking parts agains list this afternoon or tomorrow - gardener is fighting with the ham at the moment. Have to fight a fierce battle against slugs and mice...clever beasts.

Marc, or other friends from the list, do you know whether the errata notes of V1 are enclosed as corrected ones in the newest manual version?

These new instructions don't seem to mesh with the instructions I got directly from Steve. Also bullet no. 7 in the new file I think should read turn 6 instead of 8.

Here's Steve's instructions to me for the T3 mod:

Dennis,

I assume you have the "B" manual, which does have a picture of the mounted toriod, but with the original number of turns. I have sent Doug a "B.1" version of the manual with the BLT changes, but I'm not sure it has been posted on the web site yet.

Your least confusing approach to winding the core at the moment might be to first wind the core as shown in the original instructions. Wind the primary turns first, make the center tap, then remove two turns from each side of the center tap, leaving a total of 12 turns.

Then wind the HI-Z secondary, again removing 1 turn from each side of the center tap and doing the same for the Low-Z winding.

It might be helpful to down load the BLT manual from qrpkits.com too, that has more pictures on how to wind the core, but the center tap is made in a different maner and shows the original number of turns.
72,
Steve, KD1JV
"Melt Solder"
White Mountains of New Hampshire

Here is what I wound on my T3, starting from the original instructions and applying Steve's mods listed in his email. I've not had a chance to test it out yet.

Primary - 12 turns , center tap outside of turn 6 , (61/2).

Hi Z - total of 10 turns, 5 turns on each side of the center tap.

Lo Z - total of 4 turns, 2 on each side of the center tap.

Correct. The turn number in bullet 7 appears to be a mistake. I simply downloaded the PDF from the Hendricks QRP site. Someone else does the editing.

125. The Yellow Box - just for fun

Yahoo group: pfr3_group
Date: 2008-07-19 07:30:02 UTC
From: Dieter Klaschka
Topic: 125 Message: 125

Good morning,
hi, Marc,
There will be a wee bit of time till 2 way qso, hi. I start checking parts this afternoon.
Be patient, please.
I was amused about the question on tha other list on why the box is yellow. I wrote an answer:

> PFR - The Yellow Box.
We had a Yellow Submarine, hadn't we?!
Volkswagen advertises a new car. You see it on the screen, marvellous , elegant...Then the speaker asks whether you have seen the lady with the leopard on the right. Of course you haven't since you are fascinated by the new produce.
Here it is the sun flower yellow against grey-brown-black-green of common rigs, all ticky-tacky boxes, all the same (it was a song in the late 60s I think).
But perhaps they have only had a large amount of this colour
in the stores...
PFR and Yellow will be synonyms very soon.
Advertisment via colour. Well done!
Don't take my comment too seriously. Perhaps one should ask Doug or Steve why they use yellow.
Have a good weekend,
Dieter, DL2BQD
PS my PFR3 is also yellow ;-)
I like it!

Hi Dieter

Good luck with it.. I await our PFR-3 to PFR-3 QSO to DL on 40m!

I used manual ver B which seemed to have the errata included... I notice that ver B.1 now has the latest BLT mods included too so you should be OK to use it.

127. BLT

Yahoo group: pfr3_group
Date: 2008-07-19 19:02:41 UTC
From: Joseph Feustle
Topic: 127 Message: 127

No matter what I do, I just can't get the BLT to work. Took out and rewound the toroid according to the latest specs and I still can't get the led to dim. I also don't notice any change in band noise when I try tuning with the tune and load capacitors. I mostly use coax-fed resonant antennas, so this is not a major obstacle to using the PFR-3 for now. But I'd like to get the complete rig to work, including the BLT. I've looked closely at the board several times and am now at the point where I can't see the solder connections for the components (forest for the trees?). Any and all suggestions will be appreciated.

130. PFR-3 issue

Yahoo group: pfr3_group
Date: 2008-07-20 03:26:40 UTC
From: bob4459
Topic: 130 Message: 130

Greetings,
Finished the PFR-3 and the transmit seems to work fine as does the keyer and other functions. But, the receiver is deaf. I hear the usual hissing of the receiver, but no cw signals. I compared to the shortwave this morning on 20 meters and got nothing on the PFR. I used the troubleshooting guide and hear the hum touching pins 4 and 5 on U2. Any thoughts? I did double check the wiring on T1 and I believe it to be wound and installed correctly.

Topic: 127 Message: 131

Marc,
I think that's the point when you mention type of antenna to be tuned + BLT.
I am going to use the PFR mostly outdoor for holidays - three band in one box a n d tuner/ swr-indicator enclosed.
We were on CT3 this March and I used an SST20 with a piece of ca 25 m litz wire down the balcony into a fig tree(I had the MFJ Antenna Tuner 160-10, power supply, little SWR with scale, key ... full table)
But this was possible only since the management allowed to rig the wire. I took a T-ant (wire with top hat) with me and some radials which could have been mouted on the balcony perhaps. But who knows this before?
On The Isle of Man last Sept I could use the car -12m pole and a dipole NorCal Doublet style - I tuned the K1 (20/40) with a ZM2. But now one has got three bands in one Yellow Box. Wow!

Have you made any BLT modifications or mounted it like REV B describes it?

HI Joe

I''ve been using my PFR-3 for the first time today. The tuning is VERY sharp and it depends what you are trying to tune.

My G5RV at home will tune with the PFR-3 and BLT on 20m and 30m but not 40m Whereas when out on a SOTA activation with it this afternoon (22 QSO's in 7 DXCC entities) my 88ft double Norcal doublet tuned fine on all 3 bands... after I had found the null. You have to move VERY slowly.

I wonder what other experiences we will hear about this from others.

From: Dieter Klaschka
Topic: 132 Message: 132

Hi,
It's me again. I checked all parts of the parcel agains the list - all OK. The ATME shows a red dot .
I copied the parts list first and pinned it with needles on a foam plate. Here I put all Rs and Cs in, put the transistors and sensible parts into little pieces of anti static mats and stored all neatly in old slide boxes.

My "workshop" is the writing table of the former children's room. I use a framed (wooden frame 1/2 inch) board, in the left corner there is a 10x10 ") copperplate connected via 1MOhm to the central heating, my anti static device.

If one is able to enlargen the list a bit it is useful since the parts are rather close together and it might be you do a mis-grip when you take them out for being soldered.

I used an LC meter and an Ohm meter to check the parts,
a magnifying class shows all prints fairly well though.

Next step - first parts to mount and solder due to come.
Have a good weekend all.

From: Bert M. Thompson
Topic: 133 Message: 133

PFR-3 Group,

Well it all checks out and then some! The last thing to check was the "BLT" backon lettuce es tomatoes hi. So I found a 51 ohm resistor in my junk box and was able to get the "SWR" led to go out. Up until then I was using "coax" to my Carolina Windom and using my MFJ tuner. So wanted to live test the "blt" tuner. Well I got out my 44ft "lamp cord" Norcal Doublet and threw my lead weighted tennis ball over a tree branch up abt. 30ft. Then looked for some ladder line and found none. So I went the the local "ACE" hardware store and got another 50ft of lamp cord. Retired to the comfort of the screened in back porch and connected the lamp cord to the "BLT" posts. Well to make a long story short I was able to tune 40 and 30 to lights out , however , could not get 20 to go out but was very dim. I think this is the worst case setup I can think of. By now was gg toward evening so tuned in 40 and listened around and made contack with a NH station and got 589 58n!! This the best radio I've built and now love it! Thanks to all for this great kit and to the PFR-3 group 73 Bert M. Thompson kb3mhb

135. Bad AD9834 chip?

Yahoo group: pfr3_group
Date: 2008-07-20 16:10:53 UTC
From: querencias
Topic: 135 Message: 135

After completion of the kit I found that everything is functional except the transmitter. After an initial posting and some feedback I concluded that the finals were destroyed. However, I borrowed a friend's oscilloscope and found that the output pin (#16, BIGN) of the AD9834 only had noise floating at 3.77 VDC, the noise is less than 20 mv, peak to peak. The output is pulled up by a 100 k ohm resistor connected to the +5 source. I checked the finals, 2N7000, in the circuit and they appear to be ok, and the 12 volt switch is wokring correctly, key down/up.

After changing the value of the pull-up resistor to 1 megOhm (this will reduce the current to be pulled down) the behavior was the same - only noise, but the DC level dropped to 3.5-3.6. So I ordered a replacement from Analog Devices which only costs $9. Not a bad price for such a powerful device. Won't have the new chip for another week.

The DDS chip output to the receiver labeled LO (local oscillator) seems to be fine per the scope and the receiver noise can be peaked and I have heard the output from a test transmitter.

After checking all the voltages and digital outputs on the MPU (with the red dot) I have to conclude that everything is in order and functional except the DDS output to the transmitter.

I was hoping that the problem lay elsewhere as I don't look forward to removing and replacing this surface mount device.

If anyone else in the group has experienced this I'd like to hear about it.

A few weeks ago I ordered my PFR-3 kit and now waiting for the postman to come.
It would be nice to know if there is some more SM Hams building the kit, and also working it on the bands. I have been hunting SOTA stations some weeks now, and I have some plans for next summer to use the PFR-3 from some swedish summits.
I have made lot´s of QRP QSOs so it will be interesting to see how this kit will work. With a good antenna QRP is exellent.
See you down the log!

137. RX Peaking - trimmer?

Yahoo group: pfr3_group
Date: 2008-07-21 08:20:03 UTC
From: g0azs
Topic: 137 Message: 137

Hi All

Just a quick question. My PFR-3 is working fine but I note that when I peak the RX on 40m it is near fully counter-clockwise near to the box label (per the manual) but 30m peaks near the 20m label and 20m is just peaking (I think) as the cap hits the clockwise end stop. Now I'm not sure if it's peaked so I was thinking about trimming the capacitor to see if there is more.

Am I right in thinking that fully clockwise for the main knob is minimum capacitance hence I would need to try un-meshing the trimmers to move it down a little?

Also I assume unmesh means turn the semicircular trim tabs away from the metal tab coming from one corner of the capacitor?

So do you think this might help with having a negative effect on the 40m peaking and have I made the right assumptions about the trimmer movement?

Hello Mats, and everybody here on the forum
as newbe :
a few day ago I also ordered the pfr-3 and also would like to know if there are already working rigs here in Belgium , or more ON's building the kit?
I do not know there is a sort of list where we can see the "current rigs" in operation plus their owners ?
(something like W8DIZ made a few years ago with his unique MPplus rigs)

And yes, already looking forward to the postman (for the kit) hi!

140. Tune Capacitor

Yahoo group: pfr3_group
Date: 2008-07-22 01:02:49 UTC
From: k2qpn
Topic: 140 Message: 140

I have had my PFR3 on the air for about a month. Using a vertical I have worked 24 countries and working for QRP DXCC. Everything works well except for the BLT. The tune cap (C74 & C75) has no effect. The power out never changes. The load cap seems to work OK. I have metered everthing out and resoldered the connections. No help. Almost as if the cap is open. I also had to put a resistor across the SWR LED so it would dim.

Any ideas??

>
> Any ideas??

One way of decreasing the sensitivity of the SWR LED would be to reduce the number of turns on the LED side of the SWR bridge, T2. It would have to be done experimentally but as-designed, the voltage ratio is 5:1 (25t:5t). Perhaps 4:1, or even less. I have not played with the BLT yet; I'm waiting 'til after FOBB.

144. distance betwenn board and display

Yahoo group: pfr3_group
Date: 2008-07-22 10:52:11 UTC
From: Dieter Klaschka
Topic: 144 Message: 144

Hi,
I think it would be a good idea to use a little 'helping tool' when assembling the display.
A drill with 1.6mm can be put between lower side of display and board; at this stage of building it can be easily shifted 'from the north side' under the display. A small stripe/ piece of board(the thickness of the board is about 1.7 mm)... could also do or the given excact height of the upper side of display from board
Here it is now 8.16 mm which adequates to 0.321 " (due to my slide rule caliper)

I put the assembled group1 board into the upper part of the housing: my display just reaches the lower part of the rectangle window and can be shifted unter it. It's not in the square, it's below.

At this stage of building a hint could be given, that the display should go into the window or stay just below the surface.
I compared with the pics on Doug's site , seems to be inteded this way to stay outside
.
The switch S5 on/out marks the border of the board to be put against the upper housing and I think one cannot screw the two screws on the input of socket phone and key from outside the housing otherwise the display will shift a bit outside its window...
HWT?

Anyway, building is great fun!
72,
Dieter.DL2BQD

Subject: Re: [pfr3_group] distance betwenn board and display

Hi Dieter

The phone and paddle sockets are not screwed (with a collar) from the outside of the case so no need to worry on that score if that's what you mean.

See here on mine:

http://www.flickr.com/photos/28485944@N00/2679462600/

They just "poke out" enough to be flush with the case.

73 Marc G0AZS

The switch S5 on/out marks the border of the board to be put against
the upper housing and I think one cannot screw the two screws on the
input of socket phone and key from outside the housing otherwise the
display will shift a bit outside its window...

Guys, I realize that $40 seems high for the paddles. But, there are 4 parts in the kit that had to be machined and anodized. That is not cheap for short runs. All of the hardware is stainless. Plus, I have to pay a royalty to the designer, and I need to get paid for my labor. The paddles are very rugged, simple (means that they won't fly apart when you drop them), and they work. Plus, they are guaranteed for life, no matter what happens to them. Step on it, lose a part, I don't care, I will replace it. I have had several people who have bought and used the paddles tell me how much they like them. Only one complaint until today. You also have to remember what they were designed for: A simple reliable paddle that can be taken to the field. They are not Begali's or Mercuries, nor do they cost hundreds of dollars. The bottom line is that they are available, you the buyer, has to decide whether or not to buy them. 72, Doug

From: wb8yyy_curt
Topic: 140 Message: 162

It is a bit easy to jump to conclusions, sometimes the wrong one.

The LED indeed is bright - i had thought about adding a resistor but i have gotten used to it, and learned to avoid directly looking at it.

Is your PFR3 BLT original configuration or did you reduce the number of turns per the published mod given later by KD1JV? If you have the original configuation, i am less surprised that one of your caps seems to not do much - particularly on 20m. Do you get better results on 40m?

The BLT does take a bit more training than other tuners. Unless your cap is registering a DC short with an ohmmeter, it seems unlikely to me it is defective - and i can imagine you dont have a capacitance meter handy. At a minimum i would try it on different bands, and indeed see if you have reduced the turns per the mod. without the mod, i had difficulty (as did Steve) getting any match on 20m and it was nearly impossible on 30m. as modified it works well for me on all three bands.

Grant

If I read all correctly, your receiver works but your transmitter does not ? If this is the case, your AD9834 should be working as it is both the receiver LO and the transmitter exciter. When its an LO, it quickly jumps to its lower frequency - as commanded by the controller.

You should be able to hear the AD9834 with a general coverage receiver. this should be sufficient to verify indeed it is operating at the RF on transmit and the LO frequency on receive.

Any number of small things (including possibly a bad solder joint) could contribute to your transmitter not working. No I would not replace this delicate chip just yet! Try to do some more debugging. If this DDS is working, next i would examine T/R controls and then solder joints in the transmitter path.

Still could be the 9834 chip as the tx uses a different pin than the lo signal.

Good idea to not give up yet though. Did you check the tx pin (pin 16) on the 9834 while transmitting? Also, check from pin 27 of the MPU as it controls power to the finals during transmitting.

Hi,
Just to let you know.
Smoke test 1 is done. All OK, the DDS can also be heard in a receiver.

Topic: 166 Message: 166

The Errata at Doug's HP
for the rrx section
is referred to in Vers Rev B:

-C48 and the misprint on the board - a hint in the text
-R6, R7 colour code correct in Rev A1 and Rev B
-4.7 cap or 5pF RevA: brown or green (errata says 'with a
black dot')
RevB: 4.7 or 5 pF brown

Perhaps it might help a newstarter to save a wee time and avoid
confusion.

>Hi Doug
Let me get something straight steve asked the question was the paddle
worth $40 as an entity. The answer is in my case i feel that it is
not worth $40 as i being mechanically minded and having machining
facilitys could knock one up for next to nowt. In fact any reasonable
amateur could produce a working copy using two bits from a hacksaw
blades and a centre boss made out of plastic to do the very same job
as the paddle you supply with the kit . That only answers the
question in my case . However as most amateurs dont have mechanical
tendencies or the facilities to machine or produce a copy then the
only options available are to use a comercial paddle or straight key
and therefore the paddle in their case at $40 is a sensible purchase
because it is ready machined and usable and also completes the kit .
The quality of the paddle is very good and i suspect it will last a
fair length of time, personal use of it will no doubt favour one
person more than another. I received my kit yesterday along with an
ordered paddle from yourselve which cost me $40 plus vat @17.5 %
which makes the paddle cost about $47 or about £35. Hmmmmmm if i
wasnt lazy i would have not purchased the paddle due to the cost
factor. Howevere i did and im happy with it so thats that .
cheers and 73's going to do phase 1 tonight .

169. Re: Bad AD9834 chip?

Yahoo group: pfr3_group
Date: 2008-07-24 21:18:13 UTC
From: querencias
Topic: 135 Message: 169

Yes, Indeed. Thanks for the feedback, all of which is good. I've had a lot of experience debugging digital logic insitu...the LO output appears to be good, and I did hear a signal in the right place on another receiver but suspect I was listening to the LO and not the TX,
output, BIGN signal on pin 16 of the DDS.

Other diagnostic measure that I looked at were the DDS output using a 15 MHz scope and saw only very low amplitude noise (less than 1 millivolt) riding on +3.5 VDC both key up and down - no difference in behavior. I replaced the pull-up resistor with a 1-2 Mohm with the same result - removed the NOR gates with the same result - the MOSFET that switches the Vdd to the "finals" works coreectly - have to conclude that the TX DDS output is not functional, although the LO is good (apparenty).

Anyway, I received the DDS in the mail and am going to replace it - hoping that I don't smoke it with static buildup.

let you know the outcome.

170. Ref. B A D A D 9 8 34

Yahoo group: pfr3_group
Date: 2008-07-24 21:37:27 UTC
From: querencias
Topic: 170 Message: 170

Thanks guys for the advice which was good and insightful. Took 12 minutes to remove the original AD9834 DDS but over 30 minutes to replace it.

I was really scared that I would smoke the new one, which only cost a little over $9 (plus $9 for 3 day shipping, after it reached port from China), so I constantly was grounding myself and all the tools, iron, etc. the best that I could. The operation took place in the backyard.

Now, all the tests are correect: I see +3.5 VDC key up on the inputs to the NOR gates, and watch the voltage drop to about 1.5 key down - a VERY good sign! I'm very happy about this.

However, soldering the new DDS is not easy - it was like soldering the wings of a fly - literally, I estimate that I had to make movements on the order 1/100ths - 1/1000ths of inches many, many times to get the chip lined up on the lands or vias, depending on your taste. Once lined up, I put a miniscule amount of solder on the smallest iron that I have, 15 watts with a pencil point. Only a 2-3 second touch was needed for each pin, after I got started by tacking down pins 9 & 20.

So, the moral of the story is: it can be done but all along I was worried that the board would be ruined by my clumsy manipulations. It does pay to exhaust all the possibilities that you can think of - solder bridges, cold solder joints, incorrect values for the components, but it sure does help to have an oscilloscope handy.

The best way to test the DDS, if you suspect it, is to look at the output on pin 16 U7 and check the value of the +5 VDC pullup. If the voltage is 3.5 key up and 1.5 key down then the DDS is working.

Best of luck to you PFR-3 Kit guys

The tune cap makes no difference on any band. I have not modified the BLT yet. When I get a new cap I'm going to tear it apart - do the mod and sent chip for reprogramming.

From: w8aef
Topic: 172 Message: 172

A tip for checking the number of turns on a toroid: Assemble the toroid, scan it at 600dpi (color), look at the .bmp image and enlarge the image until you can easily count the turns.

And use the mouse pointer to keep track of which turn you are on as you are counting.

Paul, W8AEF

Fellow Hams, especially QRP loyalists,

Quit your b_____g about Doug's prices! I have every Elecraft toy but the K3 and many other kit products for the QRP crowd. Doug's prices are in line with the product and especially his plug in key.... it is half the price of the KX-1 key and I think it is an easier to use product. They are both fine products but when I first tried the PFR-3 key at Dayton I was impressed immediately with the ease of use. My KX-1 key is stiffer, is not consistent, (probably need to use it more to get used to it), and twice the price. The PFR-3 key is a steal at $40.00 and I have beat the dayights out of mine lately and it keeps on giving me service.

Doug, keep up the great job! You are not perfect, nor is your product, but the one person who was perfect.... well you know what they did to him 2000 years ago. I love my PFR-3, my K toys, my Sierra..... etc. When I get done with a busy day at the office I can forget my probems and play QRP radio, thanks to guys like you.

72 and as my friend Jefff K9JP would say "Good Health",

Dave K8WPE

From: wb8yyy_curt
Topic: 140 Message: 174

Makes no difference -- i interpreted this to mean on the LED indicator. Even without the mod, the cap should at least peak the noise on 40 meters.

Yes given that it takes a few minutes to assemble and disassemble, you might as well replace the chip and mod the BLT torroid at the same time.

175. PFR-3 Paddle

Yahoo group: pfr3_group
Date: 2008-07-25 17:29:55 UTC
From: Jim
Topic: 175 Message: 175

Hello Group.

I wonder if any of you have used the PFR-3 Paddle on the KX-1.
If it plugs in via a sterio 1/8" jack, it seems to me that it
easily be modified to mount to the KX-1....anyone done it?
Hey! it's half price compared to the Elecraft paddle. JM

176. started rx section

Yahoo group: pfr3_group
Date: 2008-07-26 14:17:32 UTC
From: Dieter Klaschka
Topic: 176 Message: 176

Saturday, 16:00 local
Just to say hello,
I have just stopped soldering the rx section.
Outside 36?C, rather humid.
Will continue tomorrow with caps and other parts.

All Rs for this section are in here. When I soldered the little glass diodes I
used a croco clip to act as a 'cooler', so did I with the U5: clip on and a rubber band holds the device.

U5: One has to re-form the legs a tad bit here with a flat pair of pliers since it won't go below the level of the display, won't it? But I think the three little legs are not very keen on manipulating and rebending them.
Any hints on that matter?
There are still 5 of the same type in the box.

To bend the legs of the Rs it is useful to have a fine round pointed pair of pl. so one can bend the legs near the Rs' -body.
A fine flat tool can also be used to leave a fraction of a mm between bend & body.
My son printed Rev A for me with a color printer, I did Rev B with an old HP DeskJet 400 but only black&white.
It is absolutely advisable to have ?t in color for the checklist to mark where the parts have to go.

Just my five cents.
Have a good weekend,
72, Dieter DL2BQD

179. Question on the BLT mod

Yahoo group: pfr3_group
Date: 2008-07-27 23:20:19 UTC
From: J.-P. Couture
Topic: 179 Message: 179

Okay, we're at the last steps.

There is 4 wires that we turn around core T3. One is 30 inches (lets call it nr 1) , one 2 inches (nr 2), one 18 inches (nr3) and the last 8 inches (nr 4).

Am I right if I understand I have to remove 4 turns to nr 1 (the 30 inches long one)?

Am I right if I understand I have to remove 2 turns to nr 3 (the 18 inches long one)?

And I know its two and one turn each side of center tap.

Thanks for a quick answer!

From: wb8yyy_curt
Topic: 179 Message: 180

JP

it depends which instructions you are following. if you are using Rev A, then indeed less turns are desired. if you go to FILES within this yahoo group, then look for a message from the designer KD1JV on this topic. turns are removed from each of the three windings.

someone has posted the Rev B manual, with a note that claims that the BLT mod is included in the instructions, so if so no adjustments are necessary.

my own results, previously posted, is that the BLT as modified tunes much easier (actually it didnt at all on 20m before the mod).

see which version manual you are building with, and compare to Steve's suggestion. if you are still confused let us know.

I got the RevB.1 but the mods dont look to be included as mentionned earlier in another post.

I'll simply remove 4 turns on longer wire, and 2 turns to the two other. Should be working.

Rev B and B.1 are the same nr of turns.

I'll do the mod.

Is the BLT mod relevant to just the PFR3 version of the tuner and not the standalone BLT unit? I was wondering if this is something I may need to consider for my standalone BLT.

Dear Curt,
It's with interest that I read all the comments here.
At the moment I am still with group 2 though.
:-(

I would love to hear of some hams who are on the list and use the BLT of the PFR3 without any mods at all. Built only due to instruction of RevB let's say.
But - and it is a big but - which antenna are they using then?

If we could agree to report how the BLT is working on a (e.g.) NorCal Doublet with its common proper dimensions including the length of the feeder (that ant could be a good compromise for quick field operation and what the PFR is intended to be used for, couln't it?) then we all had kind of 'system' PFR/BLT + Ant' which one could refer to.
Or on the other hand one necessarily has to give some info on the ant used together with the BLT when mods are performed.
I am fairly convinced that my 2x20.5m dipole plus 20m feeder will make a difference to tuning a NorCal Doub.

I know that you also can lengthen or shorten a parallel feeder a certain length and so make your tuner work due to the changed impedance. Has someone tried this befor modifying the turns?
HWT?

JP

it depends which instructions you are following. if you are using
Rev A, then indeed less turns are desired. if you go to FILES within
this yahoo group, then look for a message from the designer KD1JV on
this topic. turns are removed from each of the three windings.

someone has posted the Rev B manual, with a note that claims that the
BLT mod is included in the instructions, so if so no adjustments are
necessary.

my own results, previously posted, is that the BLT as modified tunes
much easier (actually it didnt at all on 20m before the mod).

see which version manual you are building with, and compare to
Steve's suggestion. if you are still confused let us know.

Hi Dieter

Reading Steve Weber update in the files section, I conclude the mod is for those who want to use a single antenna for all bands, being a 44 foot dipole, center fed with a balanced line.

That is my case and thats why I'll do the mod. If you want to use another antenna, dipole cut to desired freq, I believe you shouldnt do the modification.

Have to say, we're two doing the project here, thats why it went faster than expected.

Also, very important, in group 2, C22 and C23 are the GREEN caps, not brown one. We shouldnt read (103) on this line, its a bit confusing. We ourselves made the error and cannot remove the caps, but I think it wont be an issue.

Also, I had fun winding the toroids. Hope I'll have fun using them. Just the T3 is left to wind.

72 OM take your time.

Dear JP,
(sry won't be impolite, what is JP standing for?) Thanks very much for your quick comment ; by the way I had a look at the three pics in your gallery a minute ago, hi.
Well, that's what I mean - one antenna, feeder, usable for all bands during FDay or /p.
If I'll cut a dipole being resonant I won't use a tuner urgently, will I?

There might be some cases of tests necessary when using a W3EDP or a long wire perhaps.
At the moment I am glad to get your answer : one non resonant 44 feet dipole shall be able to be tuned when the mods are done.
Perhaps there will be some hams who have already got some more practical experience as well on that matter...
Would be of great help before one starts cutting or rewinding
;-)

Have a nice day,
72, Dieter

If you have already wound your BLT transformer using the original recipe, give it a try. In my case, with a wire antenna around 250 feet (around 80m) in length it would not tune on 20m, and not well on 30m. I also had difficulty tuning an almost matched vertical on 20m. This prompted Steve to try with a shorter antenna, and he got similar results. Both of us found that fewer turns is ideal, and you might agree when you try it with your antennas.

Meanwhile my PFR3 is working well. My use of it testifies that one can enjoy using a rig without a RF tuning knob, though I confess to missing AGC a little bit. I did some initial filter measurements on spectrogram, that I will document and post when i have some comparable measurements from other rigs. With so many of these nice yellow boxes abroad, I look forward to QSO's with many of you.

Enjoy your building and application of the rig.

From: Dieter Klaschka
Topic: 188 Message: 188

Sry, It's me again.
JP, I think for C22, C23 there were only two of g r e e n caps in the bag. Anyway they show 103 on their bodies. They are 0.01uF as C5 and C12 are but the green ones have another inner structure (material?)

Dear Curt,
Thank you very much for your detailed answer.
That makes things a wee clearer.
Well, I will start with kind of doublet, let's say 6.50 or 7.50 m each branch (loudspeaker cable) with a feeder approximately some m longer than my 12 m /p pole.
Next experiment will be a delta loop with balun which will offer kind of directivity...
(I had used a Moxon Vertical between two poles in my garden for 20 m with a K1 during the AA test - which works really great!!!)
But have to do all smoke test of The Yellow Box before.
;-)

Subject: [pfr3_group] Re: Question on the BLT mod

If you have already wound your BLT transformer using the original recipe, give it a try. In my case, with a wire antenna around 250 feet (around 80m) in length it would not tune on 20m, and not well on 30m. I also had difficulty tuning an almost matched vertical on 20m. This prompted Steve to try with a shorter antenna, and he got similar results. Both of us found that fewer turns is ideal, and you might agree when you try it with your antennas.

Meanwhile my PFR3 is working well. My use of it testifies that one can enjoy using a rig without a RF tuning knob, though I confess to missing AGC a little bit. I did some initial filter measurements on spectrogram, that I will document and post when i have some comparable measurements from other rigs. With so many of these nice yellow boxes abroad, I look forward to QSO's with many of you.

Enjoy your building and application of the rig.

73, curt

Group 5 completed. Getting 4 to 5 W on the coax output S8.

Tomorrow, we'll try the BLT wih antenna outdoor. We finally chose to follow rev b.1 instructions and will correct if needed. T3 a bit tough to wind.

Dieter, I will give you my observations as well as the antenna used and feeder and the number of turns we did.

72

J.P. is for Jean-Pierre, my first name.

I just checked KD1JV's website and he said he was going to be away for three weeks starting July 14th hiking the AT. So if you are looking for a quick turnaround don't send it in until after his return. I wish I had seen that before I sent mine in about a week ago, now I'm stuck in limbo,sniff.

Hi, Grant,
What a question you are asking - it will all depend on situation and location.
If you can consider these before there shouldn't be too
many problems.
Staying with friends? Fishing pole, Norcal Doublet
Hotel? T-antenna - perhaps your balcony will allow - with a simple wire tuner (BLT lw); longwire run from your window dwn into a tree - if management gives permission; all can be prepared easily at home
Rent a car? LW , sock filled with sand , thrown over the highest branch..
Pole 12 m, Norcal D or homemade ant from loudspeaker cable, sitting in the car, very comfortable or an up and outer single band ant = vertical with a lower angle allowing kind of DX , needs not too much space...but a pole anyway
(I made my first JA 2xqrp with an u&o in OK land)
I have some more little ideas here
www.swschwedt.de/kunden/dl2bqd

My friend DL7UWE uses a one band ant made with coax plus stub plus wire when he uses his rubber boat in the vicinity of Berlin...You will find the table with dimensions on the web site, too.
There are more than one posibilities.
Perhaps it helps.
72, Dieter

I have operated from Europe several times. Since my primary focus is THE vacation, I take a small ham setup. The simpler the better since I may not have much time to operate. I find that battery operation is usually best - power may not be available. A simple long wire or dipole works for me. Last year, our hotel room in Switzerland was on the top floor with a balcony. Idea - Studio B. I stretched out my antenna and I was on the air. I usually had some time to operate to in the afternoon - after sightseeing and before the evening.

Don't forget your FCC license and the CEPT paperwork. Have fun.

Hello! As mentionned, output of 5w on 30 and 40, 4.5w on 20. Getting some trouble tuning the antenna with the BLT but maybe feeder is too long. Will make it shorter tomorrow after work.

I made first QSO tonite on 40 with a station in Michigan. So, I am happy!

198. just some ideas...

Yahoo group: pfr3_group
Date: 2008-07-30 10:21:50 UTC
From: Dieter
Topic: 198 Message: 198

Dear group members,
In the dl2bqd photo album I upoaded 'just some ideas' on how to build.
It's just to illustrate and visualize parts of the single steps when assembling the little yellow kit.

Perhaps other hams could follow this idea and present some new ideas under the same headline within the own picture gallery as some already have done.
The simple reason that I did it is that I am no technician at all and have got always to gain from the ideas of others more experienced. So it's kind of contribution to the group.
It will 'illustrate' the manual by the way. HWT?

I soldered T1 now and have added 4 stand-off screws to the board : it now looks like a little table and the core(s) due to come on the bottom can hang now without touching the workbench when soldering is done.

"Fun can be very yellow"
;-)
72, Dieter-bqd

199. When will I see the "litle yellow one"?

OMs, How many days will it take to receive the box withe the "litle yellow one"? I am looking as a child in my mail every day but until now, "nada"!

Is it possible to see somewhere on the Internet when they sent it from US?
Just a question from a HAM waiting to have fun.

There is plenty of wire left when you take the whole length of 24";
it's simple to measure the length of one turn and then
calculate/multiply.
If you want to save a wee bit of wire...
72, Dieter dl2bqd

I had the same issue in wondering about its progress across one continent, with no ocean in between. I thought for the cost of shipping, a service with a tracking number would be appropriate - but at least for domestic shipping it wasn't available. I know that some QRP suppliers do email the buyer when the order is shipped (and for the higher $$ for this kit it would be welcome).

As perhaps orders are slowing down just a little, maybe an email to Doug will give you some info on when your yellow box left California. Meanwhile, at least you can get familiar with the assembly manual, and gather your tools.

I am looking forward to the first PFR3 international QSO party! Of course, we'll gladly QSO with other rigs as well.

Enjoy its upcoming arrival. Upon openingly, likely you will be impressed with high quality of materials and packaging.

From: querencias
Topic: 194 Message: 202

Dieter & Bob,

Many thanks for the advice and thought. I found material related to operation in the CEPT countries via the internet - very interesting. I also found that France now will extend operating privileges O N L Y to Advanced & Extra class licensees --- guess they understand the importance of Morse
Code/CW to Amateur Radio. I've always thought it was an intrinsic and necessary element in the Ham operator mentality, and the Ham culture at large.

Dieter - you are a workhorse. You may be the most prolific contributor to the group. Having lived in Deutschland for 2 years in the US Army, almost 50 years ago, I have an understanding and appreciation for Teutonic problem solving and energy for life. What an amazing country!
I also had a good German friend with whom I worked on a NATO project many years ago - very very thorough and creative - in addition to his native tongue he spoke beautiful French, Spanish, and was conversant in Arabic (also read Latin). I like all of your hints and
techniques illustrated in your emails and photos -keep up the great work as it's very helpful.

And thank you Bob, for the advice.

This is a great group.

From: Don McBride - FIRN
Topic: 198 Message: 204

Dr Dieter,
Was really impressed with the ideas expressed so clearly with the photos you uploaded to the Yahoo PFR_3 Usergroup/ListServe.
I wish I would have seen them before building my "Yellow Wonder", but at least I will be ready for my next project -- whatever that will be.
For what it is worth, I particularly appreciated your clever parts inventory method. It is SO much better than how I have been pushing the component parts into old Styrofoam meat pans and hand-writing the part number and value with each item. Making a copy of the printed parts inventory and fastening to a sheet of Styrofoam is far more elegant and less error-prone.
Thank you for the excellent building suggestions.
... 72/73,
... Don WA3ZBJ
PS: Did the BLT mod and it does work better. Haven't sent in my chip for reprogramming yet as the rig seems to work so well -- and Steve is on vacation anyhow.
Now pondering the audio mod posted here earlier as the little Yellow Wonder doesn't seem to have a great deal of audio compared to my other QRP kits.

GREAT!

Thank you so much for that good news Dough!!

I am really looking forward to start the building project.

I will go for an expedition to Ecuador in November with the Swedish Contest team SK6M and for sure bring the PFR-3 with me .

I have been holding the callsigns HC1SK and HC7SK between 1980-1995. Would be nice to have some cw QSO from HC and high up in the Mountain of the Andes.

Look for more info on web page www.sk6m.com <http://www.sk6m.com/>

Hi there,

I found late evening we made a mistake in the tune cap stettings (the meshed mention in manual) and I made corrections. Now I can completely dim the led on a 20m dipole, strung quickly between trees, and got a 599 in Georgia.

Tomorrow, will try 40m dipole and maybe try again the 44 feet dipole.

Boy! Think you'll love the yellow!

72!

209. group 2 finished

Yahoo group: pfr3_group
Date: 2008-07-31 12:43:55 UTC
From: Dieter
Topic: 209 Message: 209

Hi,
Have finished this group and can hear the side tone, the cfm beep at
S1 keyer.
Attached one branch of my 20. feeder... but no sig on 40 yet (
12:30 utc)
Why not? Because I forgot to open Resistor var V1
:-(Stupid old man!

Q:
C16 manual : GIVE it 1/4 turn from it's factory setting. WHAT
direction to, to the max or min? Anyway , won't be much of a problem.

The elecrafters had a saying when one on their list got his K
operational:
"I got my Mojo working", "Mojo is in" (Muddy Waters)

"I got my yellow shining!"
Happy now.

Will do the other alignments later.
72 Dieter.dl2bqd

PS What forces a pensioner on a warm Friday afternoon to switch on
kind of a radio and hear some dits and dahs and then remarking to be
happy?

Dear group members,
Obviously there are various methods to take off the enamel of an magnet wire.
One can use the solder-melting-pot, or burn the coating, or put a large drop of solder to the iron and move/scratch the wire in it...
It will be tinned .
Photo album: I use this 'teaser' and carefully and gently pressing I remove the cover.
It requires a bit of feeling for the wire and a wee exercise .
The tool was designed originally to take off plastic covers. It has very fine hardened steel teeth in its 'mouth'.
It's a gem!

Never use a sharp knife, cutter...
72, Dieter dl2bqd

212. group 2 finished addendum

Yahoo group: pfr3_group
Date: 2008-07-31 14:37:19 UTC
From: Dieter
Topic: 212 Message: 212

My personal impressions so far after two groups.
Sorry , when I should carry coal to Newcastle - simply delete!
- a good preparation guarantees good work
- I use a fine solder tip, could be even finer, near to sharp pencil point tip, temps at ca 375 °C, o,4mm solder
- soldering is straight forward this way
- when do you kill a Mosfet? Try to avoid killing it by touching the ground plate of your bench often enough, don't move across your nylon carpet. Precautions are easier than fault finding
- mind that the Mosfets have to go down beyond the upper part of the display, so one has to readjust the pre-formed legs to get the part into the board: I always had a croco clip on its body to get the heat off in addition to a quick soldering action
- check each soldered part immediately after having soldered it, tick it on the schematics as done
- I worked only during day light
- read twice , check twice
- mind the hint in the manual before starting to solder to check whether e a c h leg of a
socket really goes into its hole and that U4 .386 "faces south"!

And, Mats, when you are going to start assembling, do not cut the "signal in" leg of R1 - I did - here the "ant in" will go for the smoke test group 2(in this paragraph you'll get the info that this leg is used. Using R1's own leg is much easier than to solder a new connection.
A hint before in the manual could be helpful)

Well, have a good start into a good weekend.
Yellow is fine, isn't it?!
;-)

Yeah, wasnt sure but felt this call was familiar. Now I know why hi!

Tnx QSO George. FB QRP sigs here. For our QSO, I tried the 44 feet but
the SWR on 20 looks bad. Can't tune it on 30 es 40 but for now, I'll
stick with 20 es 40 dipole.

Spread the yellow news. This rig is awesome.

216. Now started my building

219. group two smoke test, fault finding pse help

Yahoo group: pfr3_group
Date: 2008-08-01 16:17:50 UTC
From: Dieter
Topic: 219 Message: 219

Dear group members,
Came back a minute ago from a friend's workshop.
We had made all the tests:

1/4 turn of BFO cap arrow points to the crystal (up) or the diodes
(dwn)

Frequency calibration done with a counter; the basic "clock"
deviation
is only 44 Hz

the sensitivity signal in is 0,5 uV - very good.
the variable pot offers enough audio

BUT:
After all alignments there is still an extra tone of perhaps 600 Hz.
One always hears it "in the background" .

It changes audio strength together with each click of the tune
up/down switches.
It disappears when the display leds switch automatically to sleep
mode. Now the band rx is excellent.

At the first glance there is a connection between processor and
display working together and producing something multiplex

Please, you see an old man crying for help.
Any hint would be kindly appreciated.

Dieter

FB on progress! I see majority of postings coming from your
continent, but perhaps maybe we in NA got an earlier start.

A ha! Sounds like you know the cause of problem. Perhaps a
capacitor is either missing or not well soldered ? I would first
examine the board for missing parts, and then reflow some solder
joints on 'key capacitors' that can be identified on the controller,
display, and receiver power supply. Steve can likely supply a more
expert answer, except he is on the Appalachian trail last I knew,
with no email and no HF rig this time, per his last email.

Sounds like your in the BFO calibration mode. You would hear one or two tones in this mode. When set correctly you will only hear one tone. Read BFO alignment info carefully. Once pot is set right you must save it. Once adjusted you save it by clicking the menu button.See page 9 in the latest manual.

Hi Dieter,

It seems to me as if I had the same problem. I made all the tests
with a 9 Volt battery. But the voltage was below 8.5 Volts. The
'sound' disappeared after using a really good source ...

What a surprise!
Hi, Tom, good morning.
And you dare writing giving me the feeling as if beeing DL alone on the pfr server! I kill you.
;-)
Thanks a lot for your comments.
As you can imagine
it was a wee disappointing having done all the alignment - Dietmar, DL2BZE, helped me with his measuring gadgets -and then such an ugly beast of a tone stayed with the rest... Brrrr
I can write och a bissel in Deutsch, jedenfalls freue ich mich über your Antwort.
Ich bin kein Techniker, baue nur genau nach und versuche dabei, Fehler zu vermeiden... und dann passiert so ein Sch...
Jeder Hinweis ist also hier immer sehr willkommen.
Drei OM schrieben mir, dass sie den gleichen Fehler hatten, einer vermutete, wir hätten beim Abgleich etwas falsch gemach, einer sagte, dass der Ton weg war, als alles im Gehäuse war (hoppla, da kann er dann aber auch eine ander V-versorgung drangehabt haben..)
Ich habe wenigstens einige Hinweise.
I will use a propper pwr supply Labornetzteil this afternoon.
Mach's erstmal gut, schönen Sonntag,
Dieter

Gentelemen,
Thanks so much for the first hints on fault finding.
Some friends seemed to have experience the very same fault.

I do not think that we have done the alignment of 'the two tones'
incorrectly.

Will have to check
- solder joints and correct parts first
- try another voltage supply than the 9 V battery !!!!!!!
(will do the last first)

Thanks again,
I start shouting immediately again when there won't be a satisfying
result ;-)

225. Just a story

Yahoo group: pfr3_group
Date: 2008-08-02 09:46:50 UTC
From: Dieter
Topic: 225 Message: 225

While waiting for the batteries to be charged I will tell a story:

ONCE upon a time a little one was born.

He looked round and found only company dressed in glittering
hammer lacquered black, sad polished grey, army green with some
light sandy brown patches nothing he liked at all.

He asked his masters to go away and look for a proper suit.

So they went to the very north where they got the shining white of
the ice mountains and the bright light of the northern stars, they
had a long trip to the far east, passing the amber coast of the
Baltic Sea where they filled their bags with that golden yellow
color of those precious stones of Neptune and arrived just in time
to see the red sun rising on the eastern horizon. What a scenery!
Never ever they had seen such a red golden sun with a yellow brim.
The brightest yellow they had ever seen.
They went to the Antarctic and enjoyed the bluish waters with the
silver glittering of the waves before they came to the wide fields
of Californian Poppy with all the colors they could imagine which
could suit the little one. So many colors.
The asked the Bumble Bees there and the Flying Pigs which inhabited
this paradise of colors and ruled the wide fields of golden
yellow sunflowers and corn and finally they asked the
Rainbow whether she could offer a wee bit of her collection.
"Yes, of course", she said □real rainbows are female, you must know-
, "take what you want" .
So the bag was filled with the most precious collection of bright
colors you have ever seen.
When they arrived home after the long journey all the wonderful
single colors had melted into a charming, bright yellow which
brought the broadest smile onto the face of Little PFR.
And Dough and Steve and the whole community of friendly people under
a peaceful sky were happy.
And they lived happy all their days.

This Saturdaymornng I finished my 2:nd part of the kit, and all seems ok.
Just now listening on 7032 on DJ3AX/P.
BUT it seems to me that the sensitivity is not so high?
I have checkd the T1 and it is ok.
Compered to my ordinary rig IC 781 the PFR-3 is different of course, but how is your experience of the senisivity?
I have adjusted the C1-C2 to its maximum and it works ok.

Perhaps the sensitivity is ok. Any comments?
73 es gd weekend

Hello Dieter.
Tnx for your help with the R1!! I have used thar comment!
Perhaps you have seen my question about the sensitivity of the PFR-3.
There is quite a differens between IC-781 and PFR-3 of course !!

I don´t have any instruments to measure the the PFR-3, but only my ears. During noontime 40 mtrs also is not so busy with strong signals, so I will wait until the evening to make any comments.

Until now, absolutly no problems with the kit. It behaves very nice here.

So which radio is the Rolls-Royce ?? <grin>

I measured 2 uV MDS on my PFR-3 - not quite as good as the .05 uV MDS of my IC-756PROII.

But with an antenna the PFR-3 seems to hear everything the PROII does.

OM;s
I think I was to quick to comment the sensitivity of the PFR-3.
Now, at 20.20 UTC 40 meters are just filled with strong signals.I
have yo turn down the audio.
Fun to play around with the tuningknobs, and the RIT possibility.
I am using my ordinary G5RV antenna, but I would like to test my
portabel 40 meters dipol also.

I have also finished group 3, the TX segment.The voltage check was
ok, so I installed the L7 coil.

Without frequency counter and oscilloscope I haven´t been able to
check the DOS frequency and precise BFO adjusment as the IF offset
adjust.I need to visit a local HAM friend and use his equipment for
this adjustments. I hope it is ok to go with the kit and make the
adjustments later on?

Up till now absolute no problem, includning winding the coils.

Now I will take a brake for Sunday and go on coming week. (I am
pastor in a local Church,thats the reason) HI:)

233. PFR-3 BLT and the Hendricks BLT/SLT tuners, and a battery MOD

Yahoo group: pfr3_group
Date: 2008-08-02 23:22:59 UTC
From: querencias
Topic: 233 Message: 233

Bon jour mes amis,

we're leaving monday for France then Spain. The PFR-3, antenna, extra tuner (Hendricks SLT), headset, batteries, and keyer paddles are all fitted into a normal size shavie kit - amazing! A complete station for use anywhere on earth, or even in space.

The receiver section is excellent - low noise and sensitive. PFR-3 compares favorably with my Wilderness Sierra. The only major differences are the internal batteries, but the sierra has an outstanding filter,

Anyway, I've built the Hendricks BLT (balanced line tuner) and the SLT (switched line tuner)
and now the integral BLT in the PFR-3. The built=in tuner is a little harder to tune the stand alone BLT and the SLT, but all of them provide good matches to a roof mounted vertical, the Cushcraft R-7, a 20 meter half-wave end-fed wire with counterpoise. Haven't tried to tune a balanced load with any of them.

As often mentioned in the correspondence the PFR-3 tuner is more difficult to tune than the other two models - don't know why but I do know they all work. Perhaps the transformer coils have very high Q - haven't tried any measurements yet.

One fast approach it to peak the noise in the receiver using the Load and Tune controls then apply power and mimize the brightness in the LED -works pretty good.

A modification I made is to place quick disconnect lugs and spades in power lines so that one can dismount the bottom shell from the transceiver for maintenace - not a lot of room or spare wire to the power supplies.

all the best to you PFR-3 builders and operators

238. Feeder length

Yahoo group: pfr3_group
Date: 2008-08-04 01:57:27 UTC
From: J.-P. Couture
Topic: 238 Message: 238

Hi.

Is there any formula for the feeder length calculations?

Lets say I got a twin lead 300 ohms, what should be the length for
7.030 and 14.060?

Tnx es 72

Hi Doug,

Joe's is w0mqy@...
Gene's is n0mq@...

Nice presentation at Williams, I enjoyed the internet feed.
Most of the time there were 12 - 16 people online watching.

I love this radio stuff !

Jean-Pierre,
I have got a table which shows what lengths should be
a v o i d e d.
If you like I will find it in Practical Wire Antennas by John D Heys, G3BDQ. perhaps it will fit into my photo album here as well.
HWT?

243. I need help with the T3 winding

Yahoo group: pfr3_group
Date: 2008-08-04 11:51:36 UTC
From: sm7bua
Topic: 243 Message: 243

OM,s
Today it is time to wind the T3 coil.
But I a litle confused. Please help me.

It say´s in the manual:
1. Pull the 6th turn slightly away from the the middle, outside edge of the core.
2.Scrap away the insulation on the wire of this 6th turn.....(that´s ok)
3. Cut a 2" length of wire #24...(that´s ok)
BUT here comes my confusion..
4. Attach this wire to the 8th turn on the core.??????? Why just now to the 8th turn, should it not be to the 6th turn ????

I will stop my work until I got som e help.

Thank You so much

Mats SM7BUA

Mats,

I think there is a general consensus that attaching the wire to the
8th turn instead of the 6th is a mistake in the docs.

245. BLT T3 manual RevB.1 August 4

Yahoo group: pfr3_group
Date: 2008-08-04 15:12:45 UTC
From: Dieter
Topic: 245 Message: 245

Hello, dear all,
Thanks again to Grant, Philip, Joe and some others who so quickly responded also off line to the strange sound on rx...It's mended as I wrote.

I have also re-read the remarks on the T3. In the meantime there are more than 200 enties on this list which will make it difficult for a newcomer or a dummy like me to find all the necessary info.

What I found out:
There are obviously differences between original stand alone BLT (even the cores are different, the method of tapping) , PFR manuals RevA and RevB.

There are hints by Steve which relate to 'the original' but it will be not too easy to trace back what "original" is meant.
And there is a hint to check the little internal caps in the big ones when adjusting the whole system.

There are hints to 'wind following the original' and then reduce windings proportionally. Steve also explains reducing a winding more when using coax ants.

There are general hints on how to build a BLT where we can read it is better to build one for the special type of ant used than to try to force one BLT to match all & everything.

RevB starts with bullet 2 " wind 11 turns" and bullet 7 " attach to 8th turn" -
these two are regarded as typos.

Dennis gives kind of a proper summary for his own BLT windings based on Steve's advice:

Primary - 12 t , tap outside 6th turn
HiZ total of 10 turns, 5 each of tap
LoZ total of 4, 2 on each side of the tap (here Steve even speaks of ONE possible)

I think this could be a good agreement to be accepted for the T3 used together with a '44' ant i.e. NorCal Doublet...for 40, 30, 20 m.

What I would like to try is to offer a series of a couple of pics which show the practical way of winding it.
(Please see the question of Jean Pierre who even speaks of 4 wires)

My first photo in the album shows the model, step one.

The question which arose immediately when I tried to go
on 'modelling' was : Do the other wires go into the core the same way
than the first 30" one ("into the hole from top side")?

Making the tap or spreading the wires evenly or tightly together.
shouldn't be much of a problem.

XYL will be kind enough to offer a helping hand when taking the
photos, hi.

So We could have the manual illustrated this way. A large photo will
tell more than the little pic at page 12; perhaps the pad labels could
be seen on the bottom of the board in a later manual as well since
the core is soldered there. But that is for lazy people, I know.

I am looking forward to the answers for Mats and Jean-Pierre. They
could surely help to get the illustrations ready.
Any help would be highly appreciated to make life with the T3 easier.
HWT?
72,
Dieter dl2bqd gqrp

Dieter,

Excellent idea. The documentation to emulate/imitate is the new PDF for the BLTPlus. It is loaded with pictures, great diagrams, and is quite easy to follow. That's what I would like to see for the PFR-3.

Dieter, From my experience of building many BLT type tuners. I have
that non of them will match every antenna. I have tried different
cores, different turns count, and adding more capacitor. Non made a
tune all tuner. In my PFR-3 I could not match any of my antennas. But
when I did Steve's suggested mods (remove turns) I found I could
match sum of my antennas. long wire, No counterpoise antenna as sold
on ebay. So don't be afraid to experiment to get what you want. My
Carolina Windom works very good with the pfr-3 without using the
tuner. 73 George/W2BPI ---

Joe,
Well, it's just what I am looking for. I downloaded the
BLTplus manual.
Normally the instructions of the pfr manual are straight forward:
Be carful -prepare, assemble, solder, check, test&align...go on to the
next step.
That's fairly enough but some hints
especially good pictures make life for the kit builder so much easier
and reduces the chance of making extra faults and so avoids
disappointment.

250. FINISHED the PFR-3

Yahoo group: pfr3_group
Date: 2008-08-04 18:33:07 UTC
From: sm7bua
Topic: 250 Message: 250

This afternoon I finished my work on the PFR-3 " Yellow One", put my G5RV antenna to work and the power switch ON.

Everything worked AT ONCE and I made my first QSO on 40. RU3MJ was calling CQ and came back directly to my call. My report was 559 and he was a good 599.

I made T3 exactly as it was in the manual, and it worked out to fine.

I haven´t played yet with the BLT, but will try sometime. I have made a 40 meter dipol with SWR 1:1 and on 7032 and that antenna will be my prtabel antenna. I also have the possibility to work on 10 MHz. It will take me 2 minutes to change band on the antenna.

This dipole was the one I used on SM/SE-001 eith very good results on 40 meters with another QRP station (4 watts output)

Using the PFR-3 the outputmeter gives me just under 5 Watts on 7 MHz . almost the same on 10 Mhz and around 3,5 watts on 14 MHz.
I think that´s good.

I will put some pictures on the Photoside to show "The Yellow One" in front of my other "Rolls Royce"!

Finished my PFR3 today. Radio works but tuner, well no so lucky.
I wound T3 11 turns with CT, 6 turns and 2 turns. I tried 135 foot doublet, a 44 foot doublet, a 67 foot doublet, a 67/34 foot fan dipole fed with twinlead.
I noticed the written instructions don't match the schematic.
Anybody having any luck?

Topic: 127 Message: 254

I measured the wire dia that I wound on T3. It was the largest of the 3 wires supplied with the kit. It measured .032 with enamel and .029 with enamel burned away. This equates to #20, not #24.

#24 should be .020. This is probably contributing to BLT non function.

(The other two wires measured .012 and .010 which are #28 and #30).

Any suggestions? Should I rewind with #24 or change number of turns with existing #20.

Did anyone else get #20?

Thanks,

Chuck/AC7QN

Topic: 127 Message: 256

After reviewing toroidal inductors in the ARRL Handbook it appears wire dia is not a significant factor.

I'm going to use the heavier wire because it will support the toroid better than the #24.

After reviewing the files it appears the number of turns I used, 11T, 6T, 2T, was for coax fed antennas, although the printed instructions did not reflect that.

I will proceed to rewind with 12T + CT, 10T, and 4T.

257. BLT T3

Yahoo group: pfr3_group
Date: 2008-08-05 09:18:38 UTC
From: Dieter
Topic: 257 Message: 257

Hi,
I uploaded a second pic on T3.
The pic in the manual shows the pads from the top side of the board.
Here you see them from the bottom as you have to assemble the core
from there.

The sketch in the manual page 12 corresponds this way with the
windings in reality:
turn one is on the inner side of the core, turn 12 outside.
So the pads are arranged .

Please be kind enough to correct or confirm when there should be
some wrong ideas.
This also refers to my last notes "BLT August 4".
Any confirmation whether the thoughts are OK or n o t would be
of valuable help.

As the last entries on the list show - all the very same questions
we had before will be repeated by each newcomer.
So it is worth spending a wee time on reading the last comments on
BLT T3, isn't it?

Hi, Henry,
Why not? There are only 250 entries, a new BLT plus manual on
Dough's page, some general remarks on the BLT tuner by KX0R, Steve's
comments... let's say half a ton only.
I am pulling your leg.
;-)
Anyway I tried to give kind of a summary on what has been discussed
here some messages only ago.
HWT?

Haven't started building the yellow box? That is sacrilige around here.

History of this BLT:
(1) original and Rev A of PFR3 manuals use same recipe as the original stand-alone Norcal BLT. mystery is that there are too many windings for use with diverse antennas on 20m

(2) some reported issues trying to tune on 20m, so Steve decides to put up an antenna (that happens to be 44 feet total length) and reports he cannot tune either on 20m. see his email under Files where he specifies the mod (i tried it and it works well !)

(3) latest version of this manual incorporates this mod, but I hear they may be a typo on the tap point ... do keep this coil symmetrical in the spirit of 'balanced line tuner'

Not much to be confused by! Us pioneers got the priviledge of removing our board once to fix the BLT, and a second time to replace the controller chip with upgraded firmware. Part of the journey ... this is one nice rig! Now if own yahoo would give us a spell checker ...

Hi Henry,

I followed exactly the numbers of rurns written in rev B.1 of the manual.

I am tuning 20m monoband dipole FB, and not bad match on 40m monoband dipole. Feeder is 24 ft 300 ohms twin lead. Didnt try a 30m dipole at the moment.

I made some tests with 44ft but didnt work.

I'll post a picture of how I set the internal variable capacitors. This is another quick way to improve things.

Hi All:

This is the second reference to internal variable capacitors; the first being in the files section along with removing turns on T3.

There is no mention of internal variable caps in the written manual, no line item on parts list and nothing shown on schematic.

Did I miss something somewhere? Please expound on these internal variable caps.

Thanks,

Chuck?AC7QN

The following is from the files, a note to owners from Steve Weber:

"Also, adjust the two trimmer caps on the bottom of the TUNE cap to maximum
(fully meshed) and keep the windings on the toriod compressed fairly close
to each other instead of spread out over the core, other wise, you might
not be able to now use it on 40 meters."

. . . two trimmer caps on the bottom of the TUNE cap . . . led me to believe he had added more capacitance via additional trimmer capacitors.

Thanks for you response.

266. BLT Tune Cap confusion (was)Re: PFR3, BLT and a 44 ft antenna

Yahoo group: pfr3_group
Date: 2008-08-05 20:10:05 UTC
From: Bob Shilling
Topic: 255 Message: 266

I have a stand alone BLT, and don't find any reference
to these trimmers in the original manual or KX0R's BLT
Mods. The new BLT plus manual (a beautiful document -
wish I'd had that when I built my BLT) clearly shows
the trimmers and says to set them at MINIMUM (full
counter-clockwise?). And here you indicate that
Steve's PFR3/BLT mod wants them set at MAXIMUM. Is
that part of the mod, which includes the toroid
winding mods? Or is there still some conflict here? I
intend to open the BLT and see where mine are set.
It's working, but my C2 cap only works in the extreme
position. Maybe changing it's trimmers will help.

267. Re: BLT Tune Cap confusion - trimmer discovered!

Yahoo group: pfr3_group

From: wb8yyy_curt
Topic: 255 Message: 267

I confess I didn't notice or even think to notice these trimmers! Of course they are there to allow the cap to be aligned to some dial mechanism ... or for our 'more noble' application -- get just the right amount of capacitance range!

Keep in mind it is a trimmer, and it 'merely' adds a few more pF to the larger amount already there. since we can 'only' put integer numbers of turns on the coil, indeed this provides an extra technique to optimize this circuit (particularly if we have just too little or just too much capacitance).

This is obviously a case requiring some experimentation. And this can be done without removing the PC board! Don't be afraid to turn these trimmers and see what works! This is an adventure!

My own thought is that the circuit is more frequency dependent than related to any particular antenna, assuming the antenna is not too small for the operating band.

I am suspicious the trimmer will not help if the BLT transformer has too many turns for 20m operation, but it may help optimize the BLT. as one of my BLT caps is nearly up against the stops on 20m (i think on the lower cap looking down at the rig), i need to try adjusting the trimmers ... yes this is an adventure! Thanks to Steve and Doug for allowing us to participate in it!

268. Re: BLT Tune Cap confusion - trimmer discovered!

Yahoo group: pfr3_group
Date: 2008-08-06 12:55:23 UTC
From: J.-P. Couture
Topic: 255 Message: 268

I've just uploaded pictures showing my variable capacitors internal settings, and the front of the rig, showing how I can reach good SWR. 2 is for 20m, 4 is for 40m.

On the variable caps, it may be not what the manual says, I am not sure, I am not responsible if it damage your radio.

But it works, on 20 es 40 monoband. Doesnt tune 44 feet.

I am working on a youtube video on PFR3. I'll try to upload by friday.

269. PFR3, BLT, antenna

Yahoo group: pfr3_group
Date: 2008-08-06 20:34:33 UTC
From: foxishiker
Topic: 269 Message: 269

Hi all:

I rewound the T3 toroid with 11T(CT 5.5), 10T(5 each side of CT), and 4T(2 each side of CT) and installed.

I can tune my 80 Mtr dipole on all bands.

I set up a 44 ft dipole with 300 ohm feeder 28 ft long. Good on 20 Mtr and 30 Mtr but not so good on 40 Mtr (too short).

I set up a 66 ft dipole with 300 ohm feeder 28 ft long. Not good on 20 Mtr.

I've settled on a dipole 102 ft fed with 300 ohm twinlead, tunes good on all bands. 3/4 wave on 40 Mtrs, 1 1/4 wave on 30 Mtrs, 1 1/2 wave on 20 Mtrs. (This is the same length as the famous G5RV.)

Good luck to all.

Chuck/AC7QN

273. BLT T3 wire #24

Yahoo group: pfr3_group
Date: 2008-08-07 09:00:44 UTC
From: Dieter
Topic: 273 Message: 273

Hi,
The kit parts list says #24 for the wire
which equals to ca 0,5 mm

The green wire delivered is 0,8mm which is AWG between
#20=0,81 mm
#21=0,72mm
HWT?
Will that cause any problems?

274. BLT + and Steve's mods

Yahoo group: pfr3_group
Date: 2008-08-07 09:55:00 UTC
From: Dieter
Topic: 274 Message: 274

Good morning,
I had a little reading in the manual of the BLT+

There one can read that "Steve, KD1JV, made some mods to the PFR-3"

for a dipole 2x 6,70 m and a 450 Ohm ladder line 15m long.
(see page 24) This now is a good detailled reference.

The turns on his core correspond exactly with what is written in
PFR Rev B.1 group 5 SWR...

So "11 turns" there is n o typo !!

Hi Dieter:

Please see message 254 and 256. I measured wire with a 1 inch micrometer, more accurate than a vernier caliper, and got the same results, i.e. #20 instead of #24.
The larger wire, #20, supports the core better and spreads out the windings to match the board better than #24. Seems to work fine.

Steve was expecting a 3 week hike, and for the most part we have had decent Wx here in the east ... i think the 3 weeks is about up, so perhaps Steve will be home soon.

Lesson: email the provider before sending a chip to be programmed ... he made the offer on one of the QRP-L's, and when i contacted him he did warn me about his upcoming trip.

the new firmware is nice -- i like the tune feature and CW is a bit more stable ... i haven't evaluated if the memory is less pause-required -- maybe someone has noticed a difference ??

Good evening Chuck,
(I wanted to answer off group, but your em showed 'permanent error')
Thanks for your reply.
If I understand that correct than thicker wire is delivered indeed.
Perhaps some other hams will cfm that.
But perhaps in other kit parcels # 24 is #24 in the kit parts.

What I thought is that a wee thinner wire would allow to make the interwaved windings easier.

Somewhere I read that the windings should not be evenly spread around the core but rather be pressed together....

Anyway, I will finish my tx section first. Here it is too warm, 35 and more (°C) and we watched Olympics this afternoon.
So perhaps tomorrow I will solder the last Mosfets and do the pre-test.
I won't hurry and I will never ever start building a rig during summer time, hi.
Thanks for your answer and enjoy a good weekend,
72, Dieter

Hi to all here

yesterday , after +/- 2 weeks , the PFR-3 kit arrived in Belgium!

(after paying extra Custom charges of 10 EURO !!

first thing (as I saw a lot of comments abt the BLT) was winding the T-100 core

I followed the manual:

prim: 11 turns

High Z : 6 turns and Low Z:2 turns both centered auround the CT point of primair coil

The thick green wire is +/- 0,8 mm diameter so from old PC power supply ,I salvaged some colored wires with approx. same wire diameter

to make things easier ? High Z= Red and Low Z =Yel. wires

I hope this will be OK ?

I put some foto's of BLT core

hope to be QRV as soon as possible ;-)

Hi to all here

yesterday , after +/- 2 weeks , the PFR-3 kit arrived in Belgium!

(after paying extra Custom charges of 10 EURO !!

first thing (as I saw a lot of comments abt the BLT) was winding the
T-100 core

I followed the manual:

prim: 11 turns

High Z : 6 turns and Low Z:2 turns both centered auround the CT point of
primair coil

The thick green wire is +/- 0,8 mm diameter so from old PC power supply
,I salvaged some colored wires with approx. same wire diameter

Hello, Josef,
Thanks for your three pics.
Have you really wound the second and third windings symetrically
left and right from the tap?
I tried to 'read ' the photos and to recognize where the wires go.

Hi Dieter tnx for reply
Well , just uploaded 3 new pics
hope everything is a bit clear now
(I think the two secundaries are centered around the CenterTap of
the primairy winding)
in fact, I wounded "reverse" ie
I started with the primaire (green) wire, folded in two, and
soldered a small (green)wire at this middle point (first removed
the insulation)
then wounded 5 turns left and right of this CT point
then with the red wire started with 3 turns , passing the CT point
and again 3 turns
the same manner with the yellow one (just 1 turn left and wright of
the CT point

time to start now building the kit ;-))

Topic: 294 Message: 294

Hi,
I have just uploaded two pics.

The newcomer should please mind
C31. I replaced it by a smaller type so it can not conflict with the
R on the left when layed down.
Perhaps one can use a smaller type or solder under the board.

If someone could design a board with EAGLE or TARGET where the parts
will be replaced by SMDs, one could get a low power indicator thumb
nail sized.
Displayed is my model on perf board.

Hello Marc,

Nice to hear from you!

Yes, it was quite an experience, work SOTA from Kuallaberg.

Sorry, I haven□t heard you from Öland.

I will look for G/CE-005 , it has been some nice SOTA QSO:s the last weeks, plenty of time to listen on 40 meters.

Good luck with PFR-3, my Yellow One works fine on all three bands., but I need to work a little more on the BLT.

Using a good dipole on 40 with SWR 1:1 is easier!

73 es cu in the log.

Hi Mats

I'm back in G land and sorry I missed you on the air during my time in SM and sorry to cancel my Kullaberg activation. However I see yours went well and such good weather that week.

Anyway the PFR3 worked very well during my stay with use in the IOTA contest (QRP section) and SOTA chasing.

I even managed a PFR3 to PFR3 QSO (just by chance replying to a CQ) with Thomas DF7XF. To say we were pleased to have the QSO is an understatement!

73 and hope to QSO with you soon... If you hear me activating Wendover Woods G/CE-005, I will be using the PFR3.

Likely your rig is not aligned and you're the one who initiates the moving. Try using rit to tune them and keep your tx constant.

With this design your tx freq will be rock solid. There will be no drift in the classical sense.

Has anyone found a low power laptop that could be used with the PFR-3 rig? I sometimes use my pc to run the rig in "straight key" mode using its old serial port,with reed relay circuit from Radio Shack, to send and the sound card to receiver. The software I use is "multipsk" for morse code. It seems to work ok using win98 software and very rarely crashes. This is great for my shack in the basement but not for the great outdoors.

Try the 9 inch version of an eeePC from ASUS loaded with the XP
operating system. You will also need a USB to serial adaptor.

This PC is all solid state and weighs just under 1kg.

Best regards

Chris

I understand how the RIT works and I did not initiate the move, but
I do apprecate all comments.
Just as a test I tuned my Kenwood TS2000 to the same freq. and began
to monitor the pfr3 transmitter output. After a short bit, the
signal being receive by the 2000 jumped 100 khz, a little bit later
it jumped another 100. Nothing on either radio was touched. It moves
up in freq on 40 and down in freq on 30. this is the same thing my
qso's are telling me.

Hmmmm. Can't imagine the hardware doing this, so my guess is firmware (jumping in increment of 100KHz is a tipoff)??? We just may have to wait on Steve to get back from hiking to debug this issue. Kinda makes sense that 40 and 30 might be reversed depending on how the LO injection was implemented.

Does it move on 20 as well (I would guess it might move down-same as 30)?

Does it ever stabilize (stop jumping for a longer period of time) or does it continue jumping?

If it firmware others should see the same behavior, anyone else able to confirm this behavior?

Topic: 306 Message: 306

Hello,
When I thumbed thru my old files from the elecraft list I came across a mesg by Kenneth. (June 29/2001)
When he finished his K2 he wrote that he tested a vertical and a dipole. Dipole was only 10 feet off the ground.

44 ft dipole with 22 ft feeder 300 Ohm twin lead, no balun.
He used his ZM2 but the internal K2 tuner was quicker.

He tried a 13 ft 300 ohm lead and that worked well on 20 and 30 but even the ZM2 was not able to tune it on 40. Then he made it as recommended and " like magic it worked and the tuner settings stayed consistent from day to day".

13 feet and 22 feet feeders are rather short for a high antenna anyway I think, but Kenneth was operating from a caravan camper.

What I want to show is that certainly the feeder length plays a role when tuning single bands, not only the windings on the core of the BLT.. I think that in one previous msg I had mentioned this. "What feeder lengths to be avoided".

I would love to hear from other users of the PFR whether their BLT works properly with a "44" dipole or if they use the coax socket and attach a resonant single dipole.
...or which o t h e r ant is their favourite and how can it be tuned with the BLT ?

In the meantime there are so many list readers here that we could have some really good statements on the BLT .

HWT?

Playing with the PFR3
Hi all
well i have finished my PFR3 and noticed a number of things .
1st when i built stage 1 and tested it the micro and display camew on instantly however now i have finished it the micro and display will not start when i power up the set. I have to slide the bandchange switch up and downm a couple of times to make the micro kick into action .
2 the sensitivity seems ok but im not happy with it . If i connecvt the antenna direct onto he plat of C1 then signals are good and strong however with the antenna connected to the coax input there is a marked reduction in sensitivity . i cant see anything wrong with T1 but im going to try to modify T1 by making it the same as T2 with a tap at 5 turns up to see if that helps .
Tx is functioning fine with 5 watts on all band,

anybody have the same problems .
cheers
Roy

Yes some things appear to be amiss, so you are not to the finish line yet!

For the sensitivity matter, do experiment with backside toggle switch (it is not intuitive to me anyway, so get a feel for what this thing does with an antenna connected to the coax connector and varying the BLT/coax switch arrangement also on the top panel. I recommend starting with a matched antenna (or via an external tuner) to get the coax path working. Certainly the noise/signals on each band should peak with the preselector control. If all this is well, then its on to doublechecking the wiring of the BST coil.

Do evaluate solder joints in these related areas -- and I have experienced some visually good joints that aren't good, but more often you will see it is not well connected.

On the display related issue, i can't discern if toggling the switch is a mechanical or electrical stimulous into functioning. Definitely examine and consider reflowing relevant pins on the controller and display ICs. And do check the solder contacts on the switch itself -- these heavy connections require a bit more solder.

If debugging these gets you down, enjoy what the rig is doing already, in particularly when you achieve fixes for good sensitivity. proceed with patience as you are almost there.

73, curt

I am not aware of any drift on my PFR-3, however I have noticed a flakey:
sometimes when I am tuning downward, the tuning stops and the display shows
something that is not a frequency (just blinks, to fast to really observe),
the receiver goes dead and then seems to come back to life. At the last
'good' frequency it was tuned to.

Topic: 314 Message: 314

Guys, I tried to find the specific data of this core and had a look at
the AMIDON site.
There is only the T106-2. It's code color is red brown now since
lead is avoided in the material.
I ordered a T106-2 from a supplier which has the same dimensions and
same color.
Is T100 in the parts list only a typo or an older version?
Anyway both -2 should have 30 MHz max.
HWT?

>Chris,

I called ASUS and found the EeePC can be bought from "Target.com" and NewEgg.com. I spoke with someone from ASUS about adding XP operating system and a usb to serial port. But they were not very helpful. I think one has to buy the machine before they will provide any technical details. I think the EeePC would be great for hams and their field rigs,however, getting the details from ASUS seems hard.

Thanks again Chris Bert M. Thompson kb3mhb

Bert,

Try www.eeeusers.com. They have a lot of info there and several have successfully laoded XP on the eee. No to be condescending but you can also purchase an eee with XP preloaded.

I confess i was puzzled by the T106 and T100 variations (one is supplied in BLT and the other in the PFR3, at least in the instruction manuals.

If this small difference in diameter was signficant, perhaps none of our BLT circuits would work since there is likely more variation in how we wind the coils !

Yes presumably if you have the same -2 core material, then all should be well relative to its use.

By the way, in terms of estimating inductance, W8DIZ has (last time I was there) a wonderful torroid calcuator utility that can be downloaded from partsandkits.com. In addition to calculating inductance for various size and type cores, he also provides a calculation of wire needed. But I think it only works for the sized cores in his store (which is more than I have ever used).

Hi

Try this site for the official position

http://eeepc.asus.com/global/product.htm

If you click on the models you will se they come in both Linux and Windows XP

Try this site for the stuff people do to their eeePC, some of it is pretty some of it is ugly. Their is a very good tutorial somewhere in this site that describes how to strip XP down to less than a couple of hundred meg for installation.

http://forum.eeeuser.com/viewforum.php?id=12

Have a look at this one way over the top but it provides real detail.

http://beta.ivancover.com/wiki/index.php/Eee_PC_Internal_Upgrades

Have fun reading.

Chris

Greetings Roy,
Interesting, I too have the micro display not come on, although I hear the hiss in the headphones. I cycle the power a time or two and it comes on. I have not tried the bandswitch. Another post had someone put the chip in the socket backward. I did to after it came back from reprogramming. It seems to function fine though.
I do have another issue, if I can actually get time to troubleshoot, and that is the receiver is deaf, I cannot hear any signals at all, even when the band is hopping (last contest on 20 M) I hear the hiss fine, but no signalss. I hope someone has experienced that and can give me a suggestion. I have a scope and an antenna analyzer that I can use for signal input, be next week before I do that though.
All suggestions appreciated,

Playing with the PFR3
Hi all
well i have finished my PFR3 and noticed a number of things ..
1st when i built stage 1 and tested it the micro and display camew on instantly however now i have finished it the micro and display will not start when i power up the set. I have to slide the bandchange switch up and downm a couple of times to make the micro kick into action .
2 the sensitivity seems ok but im not happy with it . If i connecvt the antenna direct onto he plat of C1 then signals are good and strong however with the antenna connected to the coax input there is a marked reduction in sensitivity . i cant see anything wrong with T1 but im going to try to modify T1 by making it the same as T2 with a tap at 5 turns up to see if that helps .
Tx is functioning fine with 5 watts on all band,

anybody have the same problems .
cheers
Roy

From: rkavampsev@aol.com
Topic: 329 Message: 329

Well at last im happy. all except for lazy starting of the pic but thats another story .
I changed t1 to a tapped 40 turns with the tap at 5 turns up and wound like L1, selectivity has improved trememdously, also removed R1. On the TX side ive also padded C72 C73 with a 250 pf fixed and now i can tune my half size G5RV to zero brightness on the led on 40 mtres. , I will leave it like that and if neccessary put a switch to switch it in and out if required. Never used a paddle before so trying to get used to it . however ive decided that this little yellow box is a JEM.
73's and see you 7030.
Heres a question for you all .
There are a lot of stations on 40 metres at the moment calling CQ and finnishing the call with _. ..._ ie N V WHY???? what does it mean please .
cheers

Roy

331. Changes to PFR-3 since REV B.1?

Yahoo group: pfr3_group
Date: 2008-08-17 00:04:50 UTC
From: Alan Ostroff
Topic: 331 Message: 331

Ordered my PRF-3 and I'm eagerly awaiting arrival of the kit. I scanned the assembly manual and saw much confusion regarding the assembly of T3. Sure, the 2" wire connects to turn #6, not #8, but what's going on with the 2 extra turns for the LZ winding?

Has anyone put together an errata to help clarify these or any other issues? I noticed the errata on Doug's site but didn't see any mention of the typos regarding T3.

It would be great to get a heads-up before diving in. I'm as excited as I was when I built my first Heathkit digital clock!

Thanks,
Alan

Hi, Alan, I don't presume to give hints , please be cautious and take a wee bit of time to skim previous messages in the time you are waiting for delivery.
There are all the aswers to your questions I think.
I also believe the next pfr builders will have the very same questions, won't they?
So a date-marked note in the FILE section might be helpful indeed.

Hi, dear all,

Perhaps these lines may help. My personal experienc with T3

In the album you see the toroid photos of the ham from ON,
Josef, and in my gallery you see one pic which shows the BOTTOM side
of the board and the marked/named holes, where the wires have to go.
Put both together.

(The original BLT schematic gives a good basic orientation:
main winding 2x8=16>caps, tap>ground,
HZ12 > switch
LZ6 turns >switch.

You can also have a look into the manual of the new BLT+, there are
some pics as well.)

Mods pfr-3:
Obviously the 11 turns (main) go to the Cs (polyv...). When I wind
them, I put a pointed toth picker under the wire at 5.5th turns. This
creates a little 'hole/bump' for the tap. Press and form it with your
fingernails, hi.
Otherwise you can just
scrape the insulation when wound (a small little file to file keys
with
will do perfectly) , tin and solder a bit of wire to the tap - it can
even be a rest leg of an R which is already tinned. The hole for the
tap is nearby, isn't it?

Then wind the 6 turns(High Impedance,Z) -3 on the left, 3 on the
right of the tap Tnx Josef for your pics!
You see that the holes on the board are not correctly on the
circumference line - indicating that one turn is 'in' the
toroid/core, the other outside.

Finally you wind the LowZ windings= 1 left of the tap , one right,
i.e. you won't have much choice, simply try to space them a wee bit
and wind between the other windings.
There is no large effect on symmetry when there is a space of x or y
mm (fractions of an inch).

I took some other colored enam. wire from the junk box
to differ between green(delivered) and the HZ turns. The difference
between delivered diam and diam AWG in the manual doesn't really
matter. The thicker the better.

I can't say anything on the effect of squeezing the turns or leaving them on the whole winding space. Steve mentioned he has sq. them. Normally we spread windings on the whole core.

There isn't any mystic thing there with T3, simply be correct and check that
you don't mix up with the holes and the wires.

Don't hurry when winding; perhaps you can wind a 'model' with plastic colored
wires beforehand and put it into the board without soldering, just to be sure.
This way you also get a thumb measure of how long the single wires are.
HWT?

335. Keyer problems - even with latest firmware

Yahoo group: pfr3_group
Date: 2008-08-17 15:32:27 UTC
From: Bob
Topic: 335 Message: 335

Hi

I have my PFR-3 working reasonably well into a matched antenna and I appear to have the latest firmware revision - the Atmel chip has a big red dot on it and the TUNE function works.

However, I have problems with the keyer. I can enter CQ CQ CQ and when it's played back it comes back as AWA AWA and various other odd characters. The keyer also seems to have ultra critical timing or some other problem which results in many more errors when I use this then when using other keyers/rigs. I've tried swapping paddles but it's still the same.

The other slight concern I have is peaking the rx input tuned circuit. There's a clear peak on 30m but on 20m and 40m its a very flat response with the noise level increasing at each end of the capacitor rotation, rather than a very clear peak. I've re-wound and checked the torroids and all is well.

Any advice on either of these issues would be very welcome.

Well Doug I checked the PA the best I could and it appears that the N MOSFETS (BS170) q7,q8 and q9 are gone. Using my "dvm" and repeating group 3 pertests I measured abt 2.5 volts on the outputs of the nor gate U8. I have not removed any parts yet and I'm not sure I could test the MOSFETS. I also ohmed the circuitry in this area and all is intact. This is the first time in my life I've had lightning damage. I will pay postage and any fees that are necessary... I miss the little rig. Let me know how you want to handle this and I'll comply.

Thanks agn Doug es 73 Bert M. Thompson kb3mhb

Topic: 341 Message: 341

Just finished up the Flying Pigs RFTB with my PFR-3, but tried to go with the new FT-817. You see, Pres. Bush personally sent me this check and TOLD me to buy it. (Anyone remember "the devil made me do it" ?)
Anyhow, quickly switched to the Yellow Wonder because it hears better and particularly so on a noisy band like 40 meters tonight with all the QRN. Signals just seem to jump out of the background.
Need to send in U6 for reprogramming but just can't give up time on the Yellow Wonder!
Way to go Steve Weber!

Alan,
The problem of having to compare details of manuals/ schematics will occur to each newcomer who just seriously starts building.
A kind of summary of errata or hints would be for the sake of a very new starter and would only qualify
the standard of PFR support as to say.
Or he has got to 'thumb thru' all the >300 messages ...
I do think there are no exceptional significant changes since REV B.1 Manual by now and all were mentioned in the one or other message
on the list here.
Most confusion gave T3 I believe. How to wind, proper number of turns, how to put the wires in, which steps to do first, wire diam., tuning etc etc,
some details of how to construct or solder which part first, proper power supply, finally perhaps the processor and key and its behaviour. And some few simple typos.
But I strongly believe that a new manual will be illustrated, explained, extended with constructional details ... since it is no paper manual it can very easily and quickly be done. There are so many hints on the list now.
Doug's ears must be ringing (sry it's a German saying, ears ring when someone speaks about you)

(what gave me personally some confusion is the simple fact that there is a BLT kit already sold and there are still so many remarks on the internal BLT/pfr, anyway we are to experiment, hi).

Well, that's all for the time being.
Thanks for your reply.
HWT? How is that?

I like Steve's SKC chip. It has a simple menu, and a nice feel, easy to use, but no memories tho. I've built it into a couple of rigs and into one memory keyer. It's cheaper than dirt and works vy well.
http://kd1jv.qrpradio.com/skc/SKC.HTM
Doug also has it in a vy nice kit as a promotional item.
http://kd1jv.qrpradio.com/skc/SKC.HTM
It can be fed into the straight key inout but neither the PFR3 or any of the ATS3's memory functions will work.

FWIW, If I had a PFR3, and didnt like the feel, I'd plug in an external memory keyer and wait for Steve to address it when he's rested up from the trail. The code in my ATS3 is very comfortable and accurate, at least at my slow speeds.

I do enjoy this reflector, especially since I have the first cousin of the PFR3.

I love this radio stuff !

From: Dieter
Topic: 352 Message: 352

Hello,

bullet 1.
I think one can check the 100k at the moment before it will be soldered. Why is there an extra check here.

In the assembly list there is only the 14 point socket - of course you must put in the 74HC (it's mentioned in the old manual version)

http://www.farnell.com/datasheets/43294.pdf
Here you can see where pin 1 is. Have a look at the schematics and you'll also see that pin 1 leads to Q7. So pin ONE is the top left nr the little notch. One can put the test probe of the DVM on top of the board.
A number on the board or in the pic page 10 of the manual showing pin 1 and pin 14 would help the inexpirienced ham friend to find the test points.

bullet 2
my straight key is built from a telegraph relay having gold contacts. The lever has two little knobs glued from a childrens' 'flee hop game'. It is enclosed in a plastic screw box from a DIY shop. It is very light weight and I like a heavier one when operating (KENT key or PALM paddle with a metal base)

I know , I may carry coal to Newcastle but perhaps it helps.

Bob
How much RIT is in that radio? I may want to do foxhunts with it. Can I go at least 1 khz on either side of center frequency?

As far as I know, there is no RIT limit within the band. I have gone 2.5 KC.

George, Bob,

I have been using a "picokeyer" for a year and like it. It fits in a small can and what not. I found that as I got better with the paddle I had to add the 50k linear pot which takes up room. I guess it could

be added with a knob sticking through the top. hi hi Anyway the external keyer has to be used in the "stright-key-mode" and limits a lot for functions. Also the keyer as you know has 4 memory slots, however, it's hard to hear which one has been selected hi hi. Good luck I thought I was the only one in the world who used the keyer!

Hello OMs

I would like to try to make QSOs with other owner of PFR-3 trx on 40 meters tomorrow, Sunday 24th.
I will call CQ PFR on 7028 kHz +-QRM at 14.00 UTC and hope there will be good condx for a QRP contact.
I am using G5RV antenna on 40 meters.

So hpe to see you at 14.00 UTC on 7028 kHz.

Hi Aaron
yep that sounds about right i spent days wondering why, but then i completed the rest and put an aerial on the coax input and yes it is a lot lower, so i put a ssig geny on the input and i could hear 1/4 uv ok. i think it is that fact that the bandwidth of the box is so narrow and therefore the background noise is so quiet it deceives you. i did rewind t1 to be the same as L1 and tapped it at 5 turns removed the 150 PF in series with C1 (i think) and that made the RX tuning better .
hope that helps

My PFR-3 did not require alignment.

There are many resources on the internet that can help you learn how to use your scope.

I suggest starting with a google search for Tektronix and after that Agilent.

Aaron,

Got my PFR3 yesterday, Aug 27. I didn't quite get through the group 2 assembly because there was a kitting error. It seems there should have been six 150 pF NPO capacitors sent, however I only received one. The other five were labeled 150, but that's a value of 15 pF, not 150 pF. I measured the capacitance and sure enough they were 15 pF. Check your kit. C8, 9, 10 and 79 should be 150 pF caps marked 151.

Thanks Alan,

That may well be part of my problem. I seem to recall having 3 that were labeled 150 and 3 with 151, and I didn't think anything of it, as I'm not too familiar with the labeling format of capacitors. I'd need to pull it apart again to double check on the number of each.

I finished the rest of the construction but now find that the BLT doesn't seem to work, and using balanced line 'slinky' dipole I have to use the antenna switch in the end-fed (grounded) mode and the BLT/Coax switch on the Coax mode to hear anything on the band. That said, in Coax / grounded mode, I can hear things relatively okay, but generally QRN seems to be within 1-2S units of transmissions.

These issues also might be related to incorrect caps. Guess I need to look into getting the correct parts.

Dear Aaron,
Good preparation avoids a lot of frustration.
When you have a look at my pics album you see a simple L-C-meter which is worth an investment for further projects. Indeed!
A good idea is to put all parts into a copied parts list - you will quickly find out wrong quantities...faulty marks...

I too noticed that some of the capacitors were different colors. In general this is a difficult thing for Doug to keep up-to-date and in this particular case the blue caps (COG ceramic) are what's required. I'd be curious to know how well your rig works with the 150 pF capacitors. Perhaps Doug can identify builders who received kits with the same incorrectly components and potentially save some frustration.

378. Got My Yellow Box

Yahoo group: pfr3_group
Date: 2008-08-30 10:02:07 UTC
From: w3bboqrp
Topic: 378 Message: 378

Received the kit in yesterday's mail and finished the group 1 assembly. (Works great). Started to stage the components for the next step and, like others, have the wrong 150 pf capacitors. I received four 15 pf and two 150 pf "blue" capacitors.

I do have the 150 pf "yellow" ones in my junkbox. Any problem using these? Curious to know the difference between the blue and yellow capacitors...anyone know?

Thanks,
Bob W3BBO

379. First Contact with PFR3!!

Well, PFR3 made it back from Steve's repair shop. Fired it up on 40m and after some CQing made a contact with Ervin, W4WGK in Baraboo,WI (now there's a town that will make you send ..--.. several times!!) not a bad contact using 5 watts from Pendleton,OR. Haven't checked yet to see if he was a SKCC member or not, that would make it even nicer. I was glad to hear that I hadn't botched the build to bad, had a solder bridge that 68 year old eyes couldn't see, and had T2 wired wrong. This is a real kewl Radio so far and look forward to many more contacts using it.

381. Hendricks Response?

Yahoo group: pfr3_group
Date: 2008-08-31 14:33:19 UTC
From: w3bboqrp
Topic: 381 Message: 381

I know Labor Day weekend is a busy time for everyone, but finding you have the wrong components is frustrating. I emailed Doug on Friday that I was one of a group of people that received the wrong 150 pf capacitors.

Unfortunately, that email has not received a reply. Should I expect a reply, or will the correct capacitors just show up in the mailbox?

Guess I've been spoiled by my Elecraft experiences. If I knew my email was received and being acted upon, I could rest easier. The PFR-3 looks like a great kit and I guess I'm anxious to hear it in action!

Thanks,
Bob W3BBO

Bob and others. I have been very busy this week. I teach full time, and I have family obligations. I try to check email daily, but it doesn't always get done. I don't have a staff of 30 people like Elecraft, my company is me. I don't have Elecraft prices either.

Of course I will be sending out the missing capacitors. I checked the bag, and they were marked 150 pf caps, but they were 15 pf caps, didn't know it until I sent the kits out and people reported it. I will be getting all of the wrong caps shipped on Tuesday. My policy is that I replace any part for the life of the kit. If it is my fault, I pay the postage, if it is your fault, you pay the postage.

I apologize for not getting back to you sooner, but I did not get to my email for 3 days. 72, Doug

Thanks for the reply and information, Doug.

I was just afraid that my email may have gone astray, and with it being a holiday weekend, I would lose more time in finishing this kit. I can certainly appreciate your situation, and want to compliment you on providing the QRP community with some excellent kits.

73 Doug, enjoy the holiday.

384. ssb rec with the pfr3

Yahoo group: pfr3_group
Date: 2008-08-31 20:25:03 UTC
From: merlinrail
Topic: 384 Message: 384

I just love my PFR3 cant keep away from it, and it has followed me about in the car etc, however the other day i wanted to listen to the news report on 40 metres whilst i was away from the main rec. but due to the very selective bandwidth it was not copyable . So i decided to play with the cct when i got home. I downloaded a similar cct from the KX1 and found that they have varactors to earth across the xtal filter fed by a 100k pot instead of 150pf caps so not having any correct capacitors i used 1n1004 fed via 10k resistors, the result wasnt spectacular however it opened the bandwith out for enough to copy SSB,and with the pot adjustable i could bring the bandwidth back to cw width, I will experiment further however if you down load the KX1 CCT dia you will see what i mean .
have fun

385. question and comments as I near completion

Yahoo group: pfr3_group
Date: 2008-08-31 23:34:38 UTC
From: kf6pqt
Topic: 385 Message: 385

I'm taking an air-conditioning break before I head back out to the sweatshop, er, garage, and finish the back panel wiring of my PFR3.

The receiver works, and the tx puts out full power, but I won't know if the BLT works until I try it out.

I've successfully built a lot of kits, and a had a lot of fun doing so, but let me just say that winding and installing T3 on this kit was pretty darn aggravating. This coming from someone who has no aversion to winding toroids.

The instructions for this step need to be re-written. I unwound the mess that I made following them, came in, and reverse engineered how to wind it from looking at pictures on the group site.

Now that the windings have changed from the original design, I would hope for the sake of future customers that the PCB is revised accordingly, so that everything lines up once again.

Enough about that.

About this 12.0 volt supply thing... If I don't care in the least if I'm putting out 5.5 or 6.0 watts, whats the maximum safe voltage for this radio?

Thanks and 73,
Jason kf6pqt

386. paddle problems?

Yahoo group: pfr3_group
Date: 2008-09-01 03:10:03 UTC
From: kf6pqt
Topic: 386 Message: 386

My pfr-3 is complete! I haven't had a chance to try it on the air
yet, as until I quit for the day, I was back in the garage fighting
with the (pfr-3) paddles.

Now, I've done my due diligence and searched the archives before asking...

Has anybody had my same experience where the the stereo plug refuses
to thread into the paddle body? I've tried to chase the threads on the
body, thinking that there may be some flash from the anodizing that
got in there, but I've come to the conclusion that the body was cut
for one thread size, and the stereo plug another. What gives?

Forcing it doesn't seem to help either! ;)

388. Pse. check 150pf caps in kit

Yahoo group: pfr3_group
Date: 2008-09-01 05:24:03 UTC
From: ki6ds@dospalos.org
Topic: 386 Message: 388

I got a bag of mismarked caps and inadvertantly put them in a few pfr-3 kits. Please check your kit and please count the 150pF caps in your kit. They should be blue and marked 151. If you have blue caps marked 150, don't use them as they are 15 pf not 150 pf. Send me an email with your address in the following form so I can cut and paste it.

Your Name
Your Street
City, State Zip

Thanks Doug and I apologize for the error. 72, Doug

390. 1st qso!

Yahoo group: pfr3_group
Date: 2008-09-02 06:14:00 UTC
From: kf6pqt
Topic: 390 Message: 390

Despite my earlier construction troubles, despite my being a cw newbie, despite being a qrp semi-non-believer*, ;) ,despite never using paddles in a qso before, despite deciding today that all my prior experience with paddles has been BACKWARDS, (I'm right handed and had been using my thumb for dahs instead of dits) I successfully had a qso on 40m with W7GXL in Arizona using my completed PFR-3 this evening!!!

In case anyone is interested in my impressions:

I am having the funny issue with the occasional missed dit, that I assume is the first-gen firmware issue. But my sending is such that we can pass that off as my fault, and not the radio's. ;) I'm taking this thing camping in two weeks, so I'm going to stick with the dot-less firmware level until I get back home.

I'm pretty happy with the radio. Kit-wise, it was on the difficult side at times during assembly, namely T3 as I mentioned earlier. I had to supply about 4 or 5 of my own caps, and a couple of washers, but thats ok because I got two extra red toroids for future projects, so I'm calling that even. ;)

If you couldn't tell, I have a very, very early version of the kit, I ordered it the first day it was available.

I like using the radio. If its just on and I'm listening to it casually, I'll plug a computer speaker in to it, but if I'm actually sending, I'll use headphones. I wish it could drive a speaker on its own, but I like the fact that I won't run the risk of ruptured eardrums! It sounds good.

I like the action of the paddles, but recall I'm a total newbie. I have some other paddles that others have homebrewed, but the pfr paddles seem the nicest that I presently own. Even though I run the radio off my shack supply, I still put batteries in it to make it sit still while using the paddles. I too winced at the price when I ordered them, but as someone with a toy lathe and a toy mill, I immediately recognized that the machined pieces of the paddle, though simple, are in fact time consuming to produce. I think the anodizing could have been skipped, I would have just polished the bare aluminum a bit. Perhaps others aren't as fond of bare aluminum as I am. Or as cheap. ;)

I'm not missing any vfo knob at all. The buttons do fine, and I find the direct-entry to be quite the novelty.

I still have yet to try out the BLT section. On 40 I use my 80m inverted vee fed with ladder line to a Johnson Matchbox. I'll probably try cutting out the middle man and loading up the antenna directly with the BLT. We'll see if that'll do 30 as well. I also have a "back up" coax-fed inverted vee for 20m.

*I'm shocked and amazed by an interstate qso on 5w in the summer with absolutely no sunspots. ;)

Jason

congratulations on the first QSO.

I've been a CW operator for nearly 40 years and have used all kinds of key/keyer. The PFR-3s keyer is the most difficult I've every used by far and I also miss the odd 'dit' - despite having the latest chip.

I hope a fix is on its way. Otherwise, it's a very nice little rig.

Do the caps say NPO or COG? Is there a double underline underneath
the 151?? If not, they will surely do for now but you might want to
change them out later with more stable capacitors.

Cheers,
Alan

A quick review of the schematic shows a 3.5V linear regulator, U10. The maximum safe input voltage is 16V. The other regulators, U9 and U5 can handle up to 30V input. HOWEVER, this is only true if the maximum power dissipation for each regulator does not exceed its maximum power rating. So you would need to know the voltage drop across each regulator (input vs output voltage of the regulator) and multiply this by the current passing through each regulator. This will give you the power dissipation. This value should be checked against the datasheet.

The other limiting factor would be the TX output stage. It would take more analysis to say exactly which component would fail first, but I suspect the drain-source rating of Q5, Q7, Q8 and Q9 would be in jeopardy as well as the power dissipation and drain-source voltage rating of Q6.

Good luck, 73

Am I right? If a set the rear panel switch in the binding posts direction, I'll be able to use the BLT with an antenna connected on the rear panel coax output. Right?

401. Adjustable stand and drifting problem.

From: ab0ah
Topic: 401 Message: 401

I let AD0CW use my PFR-3 a couple of times and both times he complained about the unit not setting at a comfortable position. So, I designed a simple adjustable stand and posted it to the "Photos" section.

I also posted a drifting problem (a month ago)after operating for 15 to 20 minutes. One person email me that they had the same problem and it went away when he had the FW upgraded. I sent the unit to Steve to upgraded, and my drifting problem went away also. I have not a clue as to why. 73 Larry

402. Kitting error

Yahoo group: pfr3_group
Date: 2008-09-06 17:32:08 UTC
From: gregmcgann
Topic: 402 Message: 402

I too had the same error with the 15 pF sent instead of the 150 pF, I have 2 which are marked 151, and 4 marked 150.
I have some Metallised Ceramic Plate Capacitors (disk shaped brown colour) marked 151J which might do the job?
They are not the resin dipped type, but the online documentation at maplin electronics says that 'values up to and including 220pF are suitable for temperature compensation in tuned circuits where low losses, close tolerance and high stability are required.'

Any thoughts on the subject? I may just have to wait for the parts to cross the Atlantic.

Yes thanks, I did try it and found out it works great. Made a couple contacts on the Buddistick and uploaded a picture in my album. So far so good.

Just made first "yellow" DX on 30, EG1SDC and PA0O with PFR3 and Buddistick.

The damn thing kicks ass!

Bob,

NPO and COG are the same dielectric so don't expect any change in
performance with the blue caps.

Thanks Alan, I thought they might be OK, did some further research and they checked out just fine. They may even have a slightly better temperature coefficient(NPO), the larger case size seems the only major difference.

409. PCB error on PFR-3

Yahoo group: pfr3_group
Date: 2008-09-09 16:17:06 UTC
From: KI6DS
Topic: 409 Message: 409

Steve has discovered a PCB error on the PFR-3 board. It is a simple fix and will be corrected on the next run of boards. But for those of you who have the original boards here is the info from Steve.

I noticed I have a power connection for the CPU on the wrong pin! The processor apparently is working okay this way - most of the time, but there have been a few cases where it hasn't. What I did was wire the +5 to the analog reference voltage pin instead of the analog supply voltage pin. Since I'm using +5 as the reference, apparently there is an internal connection which makes the A/D work. This should definately be fixed. Thankfully the fix is easy, as the connections are on the bottom of the board. Here is the procedure.

1. Cut the track going from pin 7 to pin 21
2. Wire a jumper from pin 7 to pin 20.

72, Doug

412. Not sure BLT is working...

Yahoo group: pfr3_group
Date: 2008-09-10 03:27:25 UTC
From: alanandcorin
Topic: 412 Message: 412

I seem to be having no luck being able to adjust the load/tune knobs to dim the LED. I thought I would simply try a few resistors connected to the coax connector. Here's my configuration:

1. Resistor across coax connector
2. Antenna switch towards banana connectors
3. COAX/BLT switch to BLT

With a 50 ohm, 150 ohm or 500 ohm resistor, using either Low Z or HI Z I just don't find a position to dim to LED. With the Low Z switch setting and a 50 ohm resistor I can get the LED to dim just a tad with the Tune switch fully counter clockwise. The Load control seems to do nothing.

Does anyone else have any experience with the BLT? Could you try a few resistors and let me know how yours reacts?

Thanks, 73,
Alan

Pablo,

Great suggestion! I unsoldered the CT winding of T3 and there were no shorts to grounds. All the cap connections checked fine. So it looks like my problems are elsewhere.

Cheers,
Alan

I took time to do this simple mod. Before the mod my keyer memory would send errors sometimes (not always same error) After the mod my memory is sent correctly every time. Would be interesting to see if progamming the memory has been improved also. Thought you guys would like to know. 73 George/W2BPI

I did two things, I changed the varicap settings as you suggested and
I also rewound T3. I counted incorrectly and had one two many turns
for each winding!

I can tune a 50 ohm load on Low Z and a 300 ohm load on HI Z but I
find both the load and tune control settings to be almost fully
counter clockwise. Is this what people find?

Cheers,
Alan

418. msg 409 error on board

Yahoo group: pfr3_group
Date: 2008-09-11 08:00:18 UTC
From: Dieter
Topic: 418 Message: 418

Good morning,
To visualize what has to be done here I uploaded a pic in the album
section.
Any good idea how to do the cut?
I use a little drill machine (Dremel, Proxon) with a dentist's drill.
A simple cutter will possibly also do.
Dieter dl2bqd

Made 2 cuts with xacto knife about 1/16" apart near pin 21 Scraped
off the foil. Scraped some of the covering off the remaining trace.
Tinned it and added the short piece of wire as needed. As I stated in
another message: my keyer memory now always sends my message
correctly. Before it would make ramdon errors. 73 George/W2BPI

Hi, Joe and George,
Thanks for the response. I presume your 'knife' is also kind of a sharp cutter with a vy thin steel blade. Right? Or what produce is an "Xacto".

I hope to go on soldering this weekend. We had a short week holiday in the Harz Mountains and I did a wee SOTA with FM. Gel battery and collapsible HB9 in the backbag did a pretty good job. The height of ca 3000ft offered a good take off into the country.
Last day I wanted to use my SW40 on short waves with 3 watts and a W3EDP;
first I could not properly match it with a ZM2, than I realised that the inner socket of the BNC has been shifted back outside the main BNC body. Fortunately I had a screw driver with me.
It's only to tell what can happen when one operates/p

I could rig the W3EDP easily into a branch with a stone and a bit of bricklayers yarn/ thin soft, strong! line. Perhaps it may be a good antenna together with the PFR-3 for 40 and 20 under tough condx. One has to change the radial only, no mast...
I have not wanted to climb up the summit with a 5 m-pole, hi.
But there might be other experiences as well.

W3EDP:
rig>ZM/BLT>wire 84ft for 20 and 40

counterpoise
17ft for 40
6.5ft for 20 and higher
I have parted the 17ft and use connectors from automobile electronics

Could someone have a try with the pfr-3?
72, Dieter

Tey are very sharp. Comes with a special handle and assortment of
blades. The blades come in differant sizes and shapes. Here they are
available in hobby stores and some hardware stores.

Dieter,

George described the Xacto knife perfectly. They are also sold in many office supply stores.

I tacked a resistor across the LED to tone it down.

I too was wondering if the LED was just too bright. But after adjusting the small trimmer caps on the bottom of the variable capacitors and rewinding T3 because I had one too many turns for each winding I found the SWR LED to work just fine. Check it out with a resistor across the output and you should be able to use the BLT to fully extinguish the LED. If the LED goes out with a resistor but not with your antenna then you probably don't have a "low" SWR.

Best, 73,
Alan

Made the PCB mod yesterday and yes, it is easy and quick -- though not pretty as someone said.
However, I'm delighted to report that this simple fix appears to remedy two problems:
1.) Some of the memory keyer sending anomolies appear to have vanished.
2.) Occasionally the display would not always power up if left in the 40 meter position. It was fine if one remembered to always leave the PFR-3 set for 30 or 20 meters.

I'm pretty delighted with the results and encourage anyone else to do the mod.

Also, with Steve being so busy, getting the EPROM chip reprogrammed seems to be a problem. On my wish list would be a way to order the updated red dot chip on an exchange basis, like returning your old car battery for a deposit. I'll bet I'm not the only one who is reluctant to live without use of their PFR-3 for some undetermined amount of time. It's a sweet rig!

one of the problems i had with me PFR3 was that when you switched it on
the CPU wouldnt start unless you slid the band change switch from 40
to 20 then back. now with the PCB alteration on pin 20/21 it starts
first time every time also my CW memory works corectly now. so well
done to how ever found the PCB problem .

I also would love an exchange program for the chip. I have been reluctant to get my chip updated since it would mean giving up my LYB. I have really been bitten by the QRP DX bug. Somehow, turning the power down on my big rig seems like cheating.

From: w3bboqrp
Topic: 433 Message: 433

Finished assembly of the unit last night and with the circuit board on the workbench, hooked up an antenna and worked two stations on 20 meters. Then I went to 40 meters and had a nice ragchew with a guy down in Georgia. Tried 30 meters using my 80 meter vertical, but not much activity on that band at the time, though I did get a ? out of GM3POI.

This morning, I got the board mounted in the enclosure and did the final wiring. Then had a nice contact with a guy in Virginia with 599 reports both ways on 40 meters.

After building many kits (K2, SST, Sierra), I must say this was a very challenging kit. T3 was a real PIA! My special thanks go out to DL2BQD and ON6WJ. Their pictures here on the webpage really helped, otherwise I'd still be scratching my head.

To those still soldering, keep at it! The rig does a good job on the bands.

I replaced the flush-mounting cabinet screws with knurled thumbscrews. After searching on the web I tried the screws that come with the Elecraft KX-1 and they work great. Elecraft part number E700050 Thumbscrew 4/40 black 5/16 cost $2.54 each plus shipping. Enclosed are some pictures. I added the fiber washer to protect the paint. The washer does not come with the Elecraft thumbscrew.

www.k9foh.net/images/pfr3c.jpg
www.k9foh.net/images/pfr3d.jpg
www.k9foh.net/images/pfr3e.jpg

I also modified the internal battery by adding an internal disconnect cable/connector so that the cover/battery can be easily removed for charging separate from the radio. There is also a cable for internal charging routed via the front case corner opening. The connector is a different size from the regular rear panel DC connector to help prevent mixing up the two. There is no current limiting circuit with this modification. But there is a posting on the group page for a different method of adding a charging circuit with protection.

Bob, it will all depend on your skills. If you don't have two left thumbs, know how to solder and possess some good tools and know that the tip of a soldering iron is somewhat hot...
;-)
Best would be to have a good friend round the corner. But this list is a powerful 'source' as well.
It is good building: only one board, concise manual, very concise,... but I think that in the meantime all faults have been reported and you will find so many hints on how to build and how to avoid mistakes and faults... so I simply advise to read all 4oo messages very carefully- yes, you have to do this to avoid questions which already have been answered - Invest that time and you will have the benefit from this investment, believe me... than you will be able to decide yourself whether you will be able to assemble the kit.
Good luck, cu later after message 410 or so.
72, Dieter

You have got to be kidding me! They charge $2.54 for each knurled thumbscrew??? I will give them to you if you send me your address!! The screws cost $.05 each, the plastic press on cap is $.12. If you paid $220 for a PFR-3, I can surely give you 4 socket head screws that cost me $.68. That is a LOT better than paying $10.16 plus shipping! That is some kind of profit margin. Sorry guys, but I just can't stand by and let this happen to my customers. 72, Doug

All the Elecraft knurled screws I have are solid metal with machined knurling. Try the ones that hold on the key to the KX-1. I think they were $6.00 or something like that when I inquired. All that machining must be expensive. Thanks Doug for your offer. I will order some for my LYB. Maybe that is an idea for your kit supply business: boxes of knurled nuts for us builders and maybe even replacements for the Elecraft guys. I do like to be able to open my radios without a screw driver.

That's one of the reasons I gave up on Elecraft. Seriously, it would be nice to
be able to change internal batteries without a screwdriver. Maybe you could list
the screws similar to the ones that hold the key on as a option?

John, send me your address and I will send you 4 of those for no charge. I think I will start putting 4 of them in the kit. You are correct, they will be the same as the ones that hold the paddles on. I will provide both the countersunk screws and the thumbscrews, that way the builder has a choice. I looked at the screw that Elecraft sells, and the one that I will send is a better one for this application as it will not stick out as far and not be as likely to catch on things. Hope you are doing well. 72, Doug

444. PFR3 on Mt. Pinos

Yahoo group: pfr3_group
Date: 2008-09-15 05:10:15 UTC
From: sigcom1
Topic: 444 Message: 444

This past Saturday, Mike Schettler WA6MER and I drove up to Mt. Pinos near Frazier Park, CA, elevation 8300 ft.. We took along the PFR3 and a K1. It was our first experience with the rig and it worked as all of you know how well it does.

We had 2 failures but not with the PFR. The internal tuner in the K1 didn't and Mike's PAC-12 refused to cooperate. No problemo, we simply whipped out a spool of "N2GO Teflon Wire" and strung up a long wire. Yep, 500' stretched across a meadow at about 20 ft. off the ground. What a hoot. It worked like gangbusters on 30 and 20 but no good on 40.

I am quite impressed with: (1.) The ease of operation. Even though I didn't read the operating instructions nor have I ever used an ATS radio I had no trouble using the rig. (2.) The QSK. I had no trouble copying between characters. (3.) The opposite sideband rejection. Wow, there is no noticeable opposite sideband! (4.) The quality of the audio. Very easy to listen to. (5.) The powder-coated housing. Very nice, and rugged. (6.) Band changes. They were much faster to do than I expected. Also, the SWR LED was easy to see even in direct sunlight.

Bottom line: Terrific radio!

Hi Doug ,I do not know how many "yellow boxes" went to Europe?
I think the postcharges for such 4 "Knurled" things would be a lot
more than the actual costs of the thumscrews.
But... I think many EU-PFR3 owners are interested
so , pse what are the costs for one set (4 screws)send to Europe ?

maybe a suggestion
I could make an order for say 10 or more set's , who is interested
could send a mail , actual costs per set = 1/10 of your cost +
postcharges of envelope in EU , no profit intentions here!

tnx for responding
best 73's to all

Warner, great idea. How about this. I will send you 10 sets, you have the
guys in Europe send you money for postage and you send them the screws.
If ok, please send me your address and I will make them up tonight. Doug

I would like to open the filter also .. not sure what the Elecraft
KX1 CCT is? Is there a way to add the circuitry necessary to open the
filter without drilling holes in the box. Also not sure where the
in4001 and 10k pot are attached to the xtal filter.

Hi bert
if you download the elecraft kx1 cct from their web site you will see that the 4.912 mhz filter is very much the same cct as the pfr3. if you take out the 150 pfs from the crystals to chassis on the pfr3 and replace them with 1n1004 and feed each 1n1004 by a 10 k resistor as per the kx1 cct and join them all together. connect a 100k pot from 5 v to chassis and connect the slider to the 10ks then you can alter the bias on the 1n1004's which will alter the bandwidth of the pfr3. Elecraft use the proper varactors but i did have any and i found that the 1n1004 did a good enough job
hope that helps, once to have downloaded the cct from the elecraft web site you will see the similarity of the to designs .
cheers

Guys there have been so many different headings and messages using them that I am confused. Here is the deal. Send me a message with Knurled Knob Offer as the subject. In the message, tell me that you are requesting the set of 4 extra Knurled Knobs. There is no charge, but I will need you to do the following in the exact same format. Type your address as such:

US, Canada and Non European DX Addresses Only:

Your Name
Your Address
Your City, Your State
Your Zip Code

All European Addresses:

Jos Warnier will be handling the distribution. I will be sending him several sets and he will reship them to you. He will post details on how to do that.

Please do not ask for more than 1 set per radio that you have. I am not in the parts business, and doing this out of my pocket for free as a service to my very, very valuable customers.

72, Doug

Topic: 456 Message: 458

Guys the following have taken advantage of the free knurled screw offer for the PFR-3. I have started including the 4 knurled screws in the PFR kits. Any PFR shipped after yesterday will have the knurled screws included. Thanks for the response and I am very pleased that I was able to make so many customers happy with such a small offer. Thanks again. If you are not aware of what is going on, I am giving a set of knurled screws to make it easier to take the top off the case of the PFR-3 to get at the batteries. All that you have to do is email me with Knurled Screw Offer in the subject line, and your address in the following format:

your name
your address
city, state
zip

That is for all orders from US, Canada, and Non Europe. If you are from Europe we will post in a few days how you can get yours. (I will be sending them to Jos Warnier who will distribute them.)

Here is the list so far. Parts will be mailed on Monday.

461. To drum for qrp

Yahoo group: pfr3_group
Date: 2008-09-20 15:20:55 UTC
From: Dieter
Topic: 461 Message: 461

Our American friends may possibly not be aware that the DL QRP group had initiated very successfully an event which they called FOX HUNT. It's a bit misleading indeed since it can't be compared with the DF FoxHunts.
On Monday evenings there are some 'Foxes' on the qrg which are announced in advance
here

http://www.qrpforum.de/hmportal.php

Many of them /p some even SOTA.
You have the task to make contacts for the sake of mutual understanding, fun, testing your equipment - no stress at all, no obligations, no " faif nain nain " only
;-)

The foxes show their logs online then.

Many European Hams applied to operate as a FOX during our spring series 2008. We had Fox-friends from so many countries.

It won't be too easy to get in touch from the state side I belive, an swl report would highly be appreciated then.

But - and it is a big but - this event offers the chance to get PFR to PFR touches from Europe.

So it depends on our own activity to use the QRGs and wave the banner of QRP.

All new PFR owners in EUland are especially kindly invited to take a part as fox or take part in this little event.

I will inform about date, times and qrg a bit later.

First start again for the autumn season will be Oct. 6th.

Kind regards,
72, Dieter DL2BQD

Glad to see our European compatriots following our lead with the QRP Foxhunt.
There has been one here for about 10 years, started by Chuck Adams, then K5FO.
There is both a Summer and a Winter Foxhunt. See http://www.qrpfoxhunt.org for
details and history of this event.

464. group 3 pretest, L7

Yahoo group: pfr3_group
Date: 2008-09-22 15:22:24 UTC
From: Dieter
Topic: 464 Message: 464

Hi, fello builders,
the next pic in my album shows the test points for the pretest.
It's just to visualize again what has to be done.

I use a regulated power supply. Again I experienced before that the 9 v battery was empty and no display to be seen. How disappointing!

L7: you see that the wire is generously offered with 8". One can leave the beginning a wee longer. It makes winding the turns a bit easier, but only a bit.

Maybe car camping or outings or a diversion from 'normal' rigs.

Rig is certainly too large for backpacking, as it is bigger than the KX1. (For that, the designer of the PFR3 has a smaller rig that sometimes fits in his backpack).

Being intimidated is a good thing. I would try to build something simpler as a warmup to build your confidence.

I dont remember any particular soldering task that was remarkably hard on this kit -- but maybe i would have to look at the board to be reminded! The instructions may require more thinking, meaning getting someone's time to provide detailed answers to your building questions would help.

For a $200 expenditure, this rig provides very high value! 3 bands, digital readout, stable transmit and receive, ... antenna tuner. QSOs can be made with this rig!

Hi, Bob and Curt,
Bob, How about simply trying to build the pfr-3.
The technical basic advantage (for me) is the one-board-construction and that all smd parts are on board.
The board itself does not offer any difficulties or in other words the only few were mentioned here by the list members.
I do not know how many rigs have been built so far but I am convinced you will get a lot of support here.
So it only will depend on your own skills.

Of course there are other little rigs on the market as well :SW series, SST, S. Weber's tiny rigs -- but all have got their own special construction features. In DL the SW40 is combined with a very good booklet which describes the single stages of the rig-circuit and so offers a very good extra help to understand their functions.
There are also
'training objects' for smd soldering techniques which are offered by DL "QRPproject" - see there - or other "riglets" - Mosquita, RockMite and others...
The pfr offers clear, easy assambling and soldering for 'medium skill' as I would evaluate it - but somehow and somewhen one has got to start.
I can only encourage you.

467. Success with PFR3

Yahoo group: pfr3_group
Date: 2008-09-23 20:00:24 UTC
From: gregmcgann
Topic: 467 Message: 467

Have been making some good QSOs with the yellow rig over the last week, building went without a hitch even though I had the kitting error with the 6 150pF caps not present (bought some more in maplin at a cost of 60p).

BLT was a little tricky though, the modifications to the number of turns means the thing won't fit well on the board (I know it's been said a few times before). This was the only major difficulty with the build, once the new board revision comes out this should be ironed out.

The mod to the IC tracks was easy (15 mins, taking my time).

Had success even with my lousy CW! (with end fed zepp at 20 meters height). Nice portable rig, no hassle taking around.

Hi Pablo,
It would be easier to wind 5, then if there is a problem, during optimization, one turn removal is a lot easier than trying to stretch another turn on.

>conundrum in version B.2 remains!

Sorry for the confusion. The T1 diagram was ment simply to show how to wind the core so the wire ends come out in the proper locations. I did not pay attention to how many turns were drawn, as I did not expect anyone to count them on the diagram and then compare it to the number called out for in the text! In any event, it is unlikely any noticable difference can be heard between having 4 or 5 turns.

Good stuff....finished mine also, boxed together 20 minutes ago, just need to sort out an antenna. Usual problems, can't count when it comes to the number of turns, a couple of tiny solder bridges causing Rx problems, luckily I purchased a jeweller's loupe, vital considering my eyesight!

will see how far 5 watts goes from Sakhalin Island....hope I can get my Reciprocal licence in the next 3 months...

cheers all

I'd hope that Bob has gotten all the answers... however, after building for many years, and working a fair piece in the communications industry, I'd bet that he doesn't have them all.... not sure that anyone does... however, with this group, he should be able to find most of them, pretty easily. If not, I'd bet they can be found.
Now, as to building itself, lets go. The PRF-3 is a pretty good start, as are a number of other kits. If one were to start with the kit of choice, and read the directions.. (I know.. that's agin the nature) then wait a day or so... and re-read the directions again, start slow, and ask questions... (man that's three strikes again nature already)... pretty soon, the whole kit will accept power.. the most important of all, the smoke, won't leak...and the entire project will work.. first time.
(Well... what did you expect, after three strikes?)--... ...--Dale - WC7S in Wy

481. Bob SST vs pfr starting kit

Yahoo group: pfr3_group
Date: 2008-09-26 07:33:11 UTC
From: Dieter
Topic: 481 Message: 481

Hi, Bob,
The SST is a good choice . I used mine on CT Madeira this spring
with 1.5 watts and a simple long wire down into a fig tree.
All the other stuff (SWR, tuner..) made it much bigger than it is
itself, hi.
I like the rig because there is no nick-nack, apply power and operate!
Perhaps you can add a BLT tuner into a wee bigger housing - not the
original - so you get a 'smaller pfr for one band' , hi
The qrg- range is rather narrow. You get the feeling as if peeping
thru a fence hole and waiting that someone passes by.
Use the SST as a training object.
Then start building a real pfr-3-bander. Wow!

Good luck, cu on air.

487. Lithium Batteries

Yahoo group: pfr3_group
Date: 2008-09-26 19:23:18 UTC
From: w3bboqrp
Topic: 487 Message: 487

I wanted to switch to Lithium batteries, not because they make for less weight to carry, but in hopes of getting more operating life out of the PFR-3 internal battery pack.

Using a fresh 8-pack of Lithium AA batteries, I found the voltage to be 14.2 Volts, a little too high for the recommended PFR-3 supply. I used a 1/2" dowel, a length of wire and two small screws to fashion a dummy battery.

With this dummy battery and 7 Lithiums, the voltage is now 12.4 Volts, good enough!

I received my knobs for the PFR3 Radio and they look really neat!!
I also looked at the outside of the mailer they were sent in and it
says it cost Doug, $1.17 to send them plus the cost of the knobs. I
don't know about anyone else but I'm going to send at least $2.00 to
him via PayPal and, if he doesn't want to apply it to the cost of the
knobs, he can use it to defray cost of those neat little "simple keyer
kits" he makes up and gives away at Hamfests and Conventions

491. group 4, low pass filters, pics

Yahoo group: pfr3_group
Date: 2008-09-28 12:15:39 UTC
From: Dieter
Topic: 491 Message: 491

Hi,
I have added some pics to the album giving some simple hints
on technology when dealing with this group.
Perhaps it helps the one or other newbie.

Count loudly - seems strange but helps to concentrate. Check turns
twice with fingernail or wooden tooth picker, place evenly round the
core.

When tinning the ends of the wires I use a croco clip Third hand and
hold both ends in them at the same time - more rigid; I turn the
holder to be sure to tin both sides of both wires.

Again the rubber band proved to be a good assistant when soldering the
2 wires of the single coils.

Finally one can grip the soldered ends of the wire with tweezers and
draw while heating the solder spot again, so the coils will get flush
with the board.

Hope it helps.

And it is indeed saved. Each time you enter the calibration mode, the
default values are reloaded as the starting point. This is done so that
there is a known good starting point each time.

It is possible (though hopefully remote) that the EEPROM data can get
corrupted, so the calibartion number could be way off. Should this happen
and the number found in the EEPROM is used as the starting point, it may
not be possible to retune to the proper frequency, or it could take a long
time to do so.

Well, I guess we can tell. It will hopefully be offically introduced at Pacificon in about 12 days if the prototype is ready by then (which it should be).

Anyway, this is a dual band rig of similer design to the PFR, but in a more traditional type case and rotory knob tuning. No built in tuner. The rig can be built for any two bands, 80 through 15 meters, your choice of which two bands. (specified at time of order, I think a high band for day and a low band for night would be the best combination). Band selection is done with a front panel toggle switch and relays. I also came up with a simple audio derived AGC circuit which will help keep strong signals from blasting out your ears. The case has a place for an internal speaker, which I'm not sure will be supplied or not yet. That will be up to Doug. Price: TBD, but a LOT less than a K1 :-)

I was wondering if anybody put 12 V on the LM386 instead of 6 V so that it might have enough output for a small speaker. I wonder what is the circuit component that does not like 13 plus volts? I think the LM386 audio output is rated to 15V.

Jim Ford, N6JF

Jim,
Some LM386s are only rated for 12V max. I am not sure which one Steve chose to use. You might try one of the voltage regulators that do not require much overhead voltage and set it for 11V. Hopefully the regulator will track once the voltage goes below 11V. Also an efficient speaker helps a lot. If you have one of the old Motorola TN6000 speakers (cast frame and metal box) that were used with the Motrac series of radios, try it. It is one of the most efficient speakers I have ever seen.

What i did for more volume was connect a small Volume control in series with a 10 uf electolitic capacitor. Then on the bottom of the board I soldered it across pins 1&8 if the LM386 audio amp. Connect + side of capacitor to pin one. This will increase audio out considerly. The small pot allows me to adjust the max output. (I used a very small pot like you usually mount on a pcb) I have not tried a speaker, but am sure I could drive one now. I did this mod becuz of hearing loss here.

Well I got the parts together ,however, could not find 1n1004 diodes perhaps you ment 1n4004. I also think I have found a good location for the 100k pot .. on top of the neaby "blt" cap. This way I can drill a hole in the bottom of the case and adjust the pot. Will start soon but miss the down time. I use my rig everyday and the condx are getting better and better.

Thanks again for the idea Roy Bert M. Thompson kb3mhb 73

From: merlinrail
Topic: 519 Message: 519

yep sorry group i did in fact mean 1n4004 diodes .
i tried 1n418s to start with but they didnt have enought swing .
have fun .
I suppose if you want you could biuld the XTAL filter as a separate
unit as the xtals are very cheep and just tag it in place with a C/O
sw to select SSB or CW.
only a thought ??
This is not so much a mod but as my CW is rubbish i have made a
Printed CCT box up which is held up the back at an angle by the two
antenna terminals and it holds a Cumbriadesignes CW reader complete
in it . the input from the cw reader is just plugged in parrallel
with the headphone socket .
the whole lot is only 1.5 inch by 1.5 inchs by 4 inches and i have
made the front with the display sloping .
certainly helps my CW, picks up power from the Dc input to the set .
have a look at .

Well, good lesson for you Doug. Do not sell good QRP rigs at
affordable prices, or you'll be in trouble.

hi hi

I was kidding. I received my screws and its just perfect. Tnx very
much Doug, this is great service.

Tomorrow afternoon and early evening, look for VA2SG/P on 20, 30 and
40 for the Polar bear moonlight madness event. Probably mostly 20 and
30, as the RTTY contest will probably make 40 unusable.

I am not myself against RTTY, I like digital, but I dont like them at
7,040.

Great pictures! Thanks. I am still building mine and hung up on the audio section smoke test. I have just about decided that the LM386 ([U4] is bad. Also, noted that the schematic on U4 is not correct. Pin 6 is acutally 5 and pin 7 is actually 6.

526. group 5 T3 main winding

Yahoo group: pfr3_group
Date: 2008-10-19 09:16:11 UTC
From: Dieter
Topic: 526 Message: 526

Here are some other thoughts from my note pad on this group.
To remember and for those who have not yet thumbed thru the previous 500 entries:

When the list came alive there was some confusion on the right numbers of turns for T3.
Then there was an article worth reading on modifications by Steve W.
After that a general agreement to use the given numbers one finds in the today's manual (I am using it September 2008).

MIND: The schematics of the tuner does not correspond at all with the now used numbers of turns - there should be a hint in the manual at least or a revised drawing!!

I have put a photo in my album showing 'group 5 RevB page 12 and board bottom side' - there I refer to 12 turns, which now should be 11!!

Manual, p 12, winding T3:
The text refers to # 24 wire. One has to check which wire is in the kit.
Mine is green enamelled 0,030 " which my compatriots on this side of the pond will easily recognize as 0,78 mm and which equals to ca AWG 20, 21. Right?

I cut ca 16" (not the 30" suggested in the manual) for the 11 turns adding a good inch at the start and at the end and wound it closely on the T 1o6-2 (the revised manual still names it as 100-2)
One mechanical turn of #20,21 on the core is about 1,41" so you can calculate yourself.

On counting:
When we follow the rule of thumb that ONE turn is when the wire passes thru the hole of the core then the tap will be on the outside of turn 6.
When you start counting from the end then the tap is on 5 1/2 indeed.
That's the miracle of the 5 1/2 turns.

When you do know that the start of the turns shall be 'in the hole' and the end outside of it because this way they suit best the position to the solder pads/staggereed holes - then it is really easy to wind the 11 turns whether you are left handed or a right hander, or even you have two left thumbs hi.
Pse cf my pic T3 model.

When finished hold the core roughly in position and you will find out the correct measures of how long you have got to scrape off the insulation at the ends.

I like the concise manual-instructions.
I would like a good photo of an enlargened core though - kind of explosive image - attached to this chapter showing all three windings with colored wires...(ON6WJ, Jos, shows it in his album)
I do not like the tiny drawing in the manual.

In the photo mentioned above I tried to mirror the places where the wires have to go to the bottom side of the board.

Since it is an electronic manual there could also be some blank space between the instruction bullets describing the single steps - this would make reading and assembling a wee easier. Space is no problem I think.

72, Dieter

Dear Pablo,

As you have read some contributions on the internal tuner of the PFR you will have found out that obviously it can not tune/match all antennas.
If your BLT NorCal has the s a m e Cs as the pfr blt has - why not replace it then. This should work then definitely together with the ants. y o u have already used/ are using.
In other words: one has got also to find t h e antenna which will be tuned with the pfr blt!

The G5RV originally was designed for 14 Mhz - no tuner at all!!
Some people use pfr with a LW plus 9:1 balun,
some 2x7.50m dipole with 300Ohm ladder line (nearly NorCal Doublet) , all with different results
etc, etc

If you might find the article by Charles Lofgren on his ZMatch designs you will easily see that it is not too easy to find satisfactory results.
The articles by the late Cebik give so many hints on antennas.
There is also the CD "SPRAT on CD" by the GQRP club which offers a bunch of hints on tuners. There is one by HaJo, DJ1ZB, who always used and uses lw with his well known wire tuner - but this of course will not fit into the cabinet of the pfr, hi... But intersting anyway.
(they, I mentioned, are the real experts!)

To compare wiring & turns:
I know that one can download the schematics of the ZM2 from the DL qrpProject homepage (or from elswhere) . This ZM does a jolly good job. It was extended by qrpproject to do even more and is known as ZM4.

What I would suggest is to build kind of an external pfr tuner with the now used Cs (polyvaricons) where you can easily change and modify turns for all three windings and test it together with
y o u r antennas or take the pfr outside and try to use different antennas with the pfr - but on antennas, that's another story..

Regards, Dieter-dl2bqd

Dear Dieter, wellcome back!
As you are (i think) an experienced builder on the pfr3 let me ask you the following:
I can not get to match the internal tuner of the pfr3t with my ant, but when I use the coax socket I can tune it perfectly with my blt norcal tuner... wich is basically the same

schematic! *but*, the core is wound with 16 turns on the primary and 12 turns to the hi z secondary. My question to you would be: winding the toroid in the internal tuner of the pfr3 with(16-12) would get me the same satifactory results than with my blt norcal tuner...? Your comments would be greatly appreciated...

I have put a photo in my album showing 'group 5 RevB page 12 and board bottom side' - there I refer to 12 turns, which now should be 11!!

Manual, p 12, winding T3:
The text refers to # 24 wire. One has to check which wire is in the kit.
Mine is green enamelled 0,030 " which my compatriots on this side of the pond will easily recognize as 0,78 mm and which equals to ca AWG 20, 21. Right?

I cut ca 16" (not the 30" suggested in the manual) for the 11 turns adding a good inch at the start and at the end and wound it closely on the T 1o6-2 (the revised manual still names it as 100-2)
One mechanical turn of #20,21 on the core is about 1,41" so you can calculate yourself.

On counting:
When we follow the rule of thumb that ONE turn is when the wire passes thru the hole of the core then the tap will be on the outside of turn 6.
When you start counting from the end then the tap is on 5 1/2 indeed.
That's the miracle of the 5 1/2 turns.

When you do know that the start of the turns shall be 'in the hole' and the end outside of it because this way they suit best the position to the solder pads/staggereed holes - then it is really easy to wind the 11 turns whether you are left handed or a right

hander, or even you have two left thumbs hi.
Pse cf my pic T3 model.

When finished hold the core roughly in position and you will find out the correct measures of how long you have got to scrape off the insulation at the ends.

I like the concise manual-instructions.
I would like a good photo of an enlargened core though - kind of explosive image - attached to this chapter showing all three windings with colored wires...(ON6WJ, Jos, shows it in his album)
I do not like the tiny drawing in the manual.

In the photo mentioned above I tried to mirror the places where the wires have to go to the bottom side of the board.

Since it is an electronic manual there could also be some blank space between the instruction bullets describing the single steps - this would make reading and assembling a wee easier. Space is no problem I think.

531. Headphones for PFR-3

Yahoo group: pfr3_group
Date: 2008-10-22 16:05:21 UTC
From: Cal Cotner
Topic: 531 Message: 531

Hi all,
Anyone have suggestions for inexpensive, sensitive, lightweight, over- the- head headphones for use with the PFR-3? Also, what impedance is recommended - low I know, but does 32 Ohms vs 16 Ohms make a difference?
I have a set of COBY CV-670 phones, with 115 dB sensitivity, but they're large and heavy. The best sensitivity (108 dB) in lightweight headphones I've seen appears to be the Sony S2.
I'd sure appreciate any suggestions.
Cal K4JSI

Thank -you- Doug for all the work you and the team put into making QRPacificon a roaring success.

It was wonderful to once again be able to attend the festivities, especially with my best ham buddy, Mike.

One thing that struck me, and I didn't even realize it until I got home and was savoring the memories, is that all the folks helping out in the QRPKits, Pacific Antennas, American Morse and NorCal booths were so pleasant. Every time I made eye contact with someone behind the tables, they were smiling. To me, that speaks volumes of their dedication.

You folks are the best.

539. final remark

Yahoo group: pfr3_group
Date: 2008-10-24 12:13:48 UTC
From: Dieter
Topic: 539 Message: 539

Hi, lads,
These may be really my final remarks. I uploaded three last pics to show some spots which should be taken care of.
This way with all my photos I wanted to 'illustrate' the manual and I hope all the future pfr-constructors and Dough will be satisfied with me.
;-)
I think assembling and soldering can be done straight forward when you know how to solder and how to read a manual. It's good to do concentrated work during daylight and check done work a day later with a magnifying glass or your xyl. Having a second eye on the board is no bad idea.
It's not good to interrupt the assembling process for a longer period. Doug will surely remember Dom, who built his pfr immediately in the hotel when he got it at the vendor evening. Wow!

I would still love to see
some remarks on how to align the little yellow box to get really 5 watts out. At the first try I got only roughly 3.

There could also be an honest list of mistakes done by the builders during the assembling process - it's no shame, it will only help others.
One won't believe what can go wrong.

Another topic could be operation experience, handling during SOTA or field days...antennas...

72, Dieter
www.swschwedt.de/kunden/dl2bqd

see photos reminder 1 - 3
1. I replaced this Elyt with a smaller type same value. When bent it will touch the R on the left
2. Transitor deep enough or it will hit its head on the roof of the yellow box
3. Mind the notches at all Us , U4!
4. Carefully and quickly solder crystals to ground
5. Flush to board
6. Mind plus and minus (band) at all diodes
7. Don't cut this R's legs before smoke test; test point
8. Mind the flat side; could be mounted bottom side
9. Some other parts are mounted on the bottom side
10. Less than 9 v may cause hum in rx; first smoke test!!
11. Here the windings are evenly spaced. It might be you have to change this during the final test. So do not fix all the turns tough

dwn to the board when you assemble this stage, do it later.
12. Carefully check for wrong, `cold' or open solder joints
13. Stiff wire. Be careful when trying to adjust it to the
staggered holes
14. Adjust to position as mentioned in the manual
15. I used a bit of RG174 coax instead of the wires
16. CT made with a rest of a leg of an R. Tiny hook an then
solder to CT position
17. Mind the correct position of the wires on the core and where
they have to go

Feel free
to continue...

540. Side tone volume control

542. 5 watt output on each band & BLT ...the never ending story...

Yahoo group: pfr3_group
Date: 2008-10-25 13:16:17 UTC
From: Warnier jos
Topic: 542 Message: 542

Hi Dieter (and all PFR3- compadres)

here I get easely 5 watt output on each band (at 12 VoltDC input)
1) I followed strictly the manual abt number of turns of the toroids
2) in each PI-section: first toroid : turns are wider spaced,
the second toroid : windings are closer spaced
(see my last foto)

abt the BLT story ,I also followed Steve's mods
I tried following types of antenna's :
G5RV, a sort of W3DZZ-dipole and a 40 mtrs longwire with 1/9
Magnetic Balun followed by +/- 20 mtrs RG58
sometimes not always easy,(sharp tuning) but could tune to 1/1 SWR
(LED completely out)in the BLT position (in the Hi or Low Z
position)
for more info concerning windings etc...pse have a look at :

http://www.norcalqrp.org/files/BLTManualPrintVersion-Linked.pdf
http://www.qrpkits.com/files/KX0R_BLT_Mod.pdf

succes and 73's to all

Hallo Dogbuilter and others on the list,
I have the same problem with the sidetone. For my own ears I prever
more loudness. I suggest to try with reducing R14 (1MEG Ohm) to 680k
or so. I will do it in the next days and will inform you than. Sri, my
English is poor, but I hope you can understand me.

Henry, please don't let a couple of guys who don't know what they are talking about discourage you. Use the latest manual on the website and you will be fine. Also, we have a policy that if you build the rig and you can't get it to work, you can send it to Steve Weber, and for a flat fee of $35, he will make it work for you, plus postage both ways. I have sold over 200 of these kits, and most are up and working. The ones who have had problems, it turned out to be their mistake, not a problem with the kit. The tuner gets a bad rap. It works fine, but doesn't work with every single application right away. You might have to change the length of the feedline, etc. but it will work. Hope this eases your fears.

Hallo Dogbulter,
I wrote that perhaps help for louder side tone reduce R14 (1MEG). I
tried now, but without sucess. Very sorry!

Perhaps an other OM have a idee for this problem?

Henry,

If you follow the current manual that is on line, all of the errata is covered - you will not need to sort thru numerous emails. I bought the PFR at Dayton and built it the following week. It worked perfectly and I have not had any problems with the BLT. I just rewound the BLT transformer and changed the 5 volt source to the uprocessor - although I have not experienced any problems. But these two steps are both part of the new manual and are done as you construct rather than after the fact.

I suggest you move forward with the build and you will have a great portable rig as a result. Rely on this list for questions and you'll have a successful build.

I wish tentec did this. My first choice of qrp kit was a tentec 1340 and I've caused some self infllicted damage to the vfo circuit. I'm a green circuit troubleshooter. My next kit will be of the yellow box variety.

Henry, please don't let a couple of guys who don't know what they are talking about discourage you. Use the latest manual on the website and you will be fine. Also, we have a policy that if you build the rig and you can't get it to work, you can send it to Steve Weber, and for a flat fee of $35, he will make it work for you, plus postage both ways. I have sold over 200 of these kits, and most are up and working. The ones who have had problems, it turned out to be their mistake, not a problem with the kit. The tuner gets a bad rap. It works fine, but doesn't work with every single application right away. You might have to change the length of the feedline, etc. but it will work. Hope this eases your fears.

Henry,

Glad to hear that you're going to persevere onward.

One more note of encouragement - I built an earlier version of the kit with no difficulty whatever - and I have had recent cataract surgery with intraocular implants in both eyes. I even had to replace the surface mount DDS chip - SO, if I can do it, you surely can as well.

This is a great little radio which I think will become a classic in HAM circles. You will find
lots of support from the great guys in this group.

best of luck de KT6L/Grant

571. Stage 2 and we have a problem Houston,

Yahoo group: pfr3_group
Date: 2008-11-01 04:56:55 UTC
From: k7ddmjb
Topic: 571 Message: 571

Hi gang,
I received my PFR3 on Wednesday and didn't have time to get started working on it until Thursday afternoon late.
I have gotten as far as page 8, where you are to set the BFO freq and check out the receiver but I have a problem. The display works fine but and I have audio white noise that changes volume with the volume control but I can hear the dds in the receiver and have lots of birdies or dds signals in the receive audio. I can NOT hear any other stations even with a wire connected to the hot end of R1, 51Ohm resistor. Any suggestions where to go from here?
BTW, the winding of T1 is NOT fun. It took me two tries and I am still not sure if I have it in correctly. Second try was a pain as I had already cut the wires clean with the board so there wasn't much to work with. I might have to re-wind in again. OH NO! VERY HARD ON MY EYES AND DIFFICULT TO HOLD THE TOROID CORE. I used a curved pair of hemostats clamped to my circuit board vice to hold the core in the air while I attempted to wind and and count the turns. I would have gladly paid someone to wind them for me if it had been an option like some of the folks in the Elecraft group does for the K2.
Any suggestions would be appreciated.
I varified all resistors with an ohm meter before instalation and did at least 2 visual checks on the caps with a glass before installation so I am fairly confident that no parts were put in the wrong places. Again, very hard for me to see the markings on the caps but we kept at it.
Thanks in advance for any advice you can offer.

Well, I finished it just about 5:30Pm. Rewound L1, and just marched on. No Receive, no transmit, but I do have audio white noise that changes with the volume control and the keyer works. Its a start. The worst of all is I am out of time now until at least wednesday as I have to go back to work on Sunday morning.
Maybe by the end of the week I can drag up a generator, hook up the scope and do some trouble shooting. I can't wait to get it on the air. :>)
It looks nice and the sheet metal is excelent. Thank you Ken. :>)
OK, my butt has grown to the chair and I need dinner. I'll keep everyone posted.

576. Paddle Input Problem

Yahoo group: pfr3_group
Date: 2008-11-02 20:11:47 UTC
From: Craig LaBarge
Topic: 576 Message: 576

Greetings:

I have a problem that first cropped up right after I finished the Group 2 smoke test. The rig no longer seems to reliably recognize the paddle inputs. For a brief time, everything seemed to be fully functional and I could hear my CW sidetone in the headphones, use the paddles to adjust the sending speed, etc. Then it stopped recognizing the paddles. All of the other functions (e.g., tuning, keyer menu, RIT, etc.) seem to be working. I can hear the menu annunciation with no problems. It just seems to be ignoring the paddle inputs.

Thinking it might be the firmware, I sent my processor chip back to KD1JV for reprogramming. I did the required mod to correct the circuit board problem and then tried the reprogrammed processor this morning. Pretty much the same result as before. I was able to send a few V characters before it stopped again.

I double-checked and verified that everything between the paddles and pins 4 and 5 of the processor is correct. I have continuity all the way from the paddle to the appropriate pins on the processor.

Any suggestions on how to proceed from here?

Thanks & 73,

Craig WB3GCK

I had a similar issue and found I had put it into the straight key mode. Just a guess. If you hit one side of the paddle does it key up and stay that way?

Ken

580. Sreve: 12 v supply?

Yahoo group: pfr3_group
Date: 2008-11-03 10:03:40 UTC
From: Dieter Klaschka
Topic: 580 Message: 580

Pse a direct question to Steve:

Will the pfr-3 bear the supply from a fully charged gel battery
which is normally more then 12 v or should there be a protective /v-
reducing diode in a line in any case?
Thanks in advance,
Dieter

I used my PFR-3 all summer at the cottage on a 12 v 7A battery without ill effect. I think the warning is for power supply users that have 13.8 v output. The guru that built mine reccomended I put a diode in the line if I ever used an ac power supply.

There are other reasons the designers might want you to keep the voltage lower. For one if the power goes over 5 watts then two things come into play. The first is the rig is "illegal" for many QRP designations because it is over 5W. The second reason is when rigs put out more than 5 W then the harmonic rejection specs get stiffer. To satisfy the specs might require one more section added to the low pass filter which adds loss, space and $ considerations. Are there any parts on the edge of blowing up at say 12.8 V? Only someone who has done testing could tell and I'm sure safety is in order.

That specification is only for transmitters 5 Watts or below put into service before Jan. 2, 2003. Everything after Jan. 1, 2003 (on frequencies below 30 MHz) must be -43 dBc. so even 5 Watt transmitters fall under the 'stiffer' reg's..

My opinion is that, under certain loading conditions, at 12 Volts the output FETs in the PFR are simply on the edge and running them higher just might push them over. I'd recommend the series diode(s). You can always switch it/them out when the batt. drops down to 12 V..

73.......Steve Smith WB6TNL
"Snort Rosin"

Ref.:

97.307

(d) For transmitters installed after January 1, 2003, the mean power of any spurious emission from a station transmitter or external RF amplifier transmitting on a frequency below 30 MHz must be at least 43 dB below the mean power of the fundamental emission. For transmissions installed on or before January 1, 2003, the mean power of any spurious emission from a station transmitter or external RF power amplifier transmitting on a frequency below 30 MHz must not exceed 50 mW and must be at least 40 dB below the mean power of the fundamental emission. For a transmitter of mean power less than 5W installed on or before January 1, 2003, the attenuation must be at least 30 dB . A transmitter built before April 15, 1977, or first marketed before January 1, 1978, is exempt from this requirement."

Thanks, guys , to all the contributions so far. There are really thoughtful answers.
Somewhen on the list you could read that even 10 watts could be expected and can be adjusted by modifying the windings of the cores to get 5 watts.

My question aims at whether the circuitry has a tolerance that it can cope with a fully charged gel battery which offers a fraction of a voltage more just after having been fully charged (but lower than 13...v I believe , and this will nor raise output remarkably) and v will be reduced during operation.
Or: will the final stage Transitor stand more than 12 v of a charged gel b. or is there a must to insert the diode to reduce voltage to security level in any case since Steve strictly designed it this way? I won't be only lucky as Marc comments, I would like to stay lucky with the little box, hi.
(so my query does not aim at qrp definitions; should be no more than 5 watts out...)
I think a quick answer by Steve could settle that issue definitely.
Thanks in advance!

The main reason for not wanting to go above 5 watts is the fact when SWR gets a out of hand, the current in the PA will increase considerably, possibly frying the PA. This problem is componded if the power output starts getting much above 5 watts.

The reason for choosing 5 watts at 12V was because this is a portable rig. That insures the power output is reasonably high when running on internal batteries.

Also, a gel cell, though initially at about 13.2 volts after being off the charger a little while, will quickly fall down to about the 12 volt level after a little use.

When I adjust the RX gain knob on 20m I have to turn full clockwise and the noise level never reaches the same peak as on 40m. I have used it on 20m at different times of day and added additional radials. Adding more radials helped with the reception but the level of noise is still lower. It's amost as if the RX knob needs to be turned more clockwise.

Craig,

There are two possible causes for your problem. One is the input ports for the keyer got blown some how and the other is an open somewhere between the port pins and the paddle.

Try using a jumper wire with one end connected to ground and ground the paddle input pins right at the MEGA48, pins 4 and 5. Pin 5 should be dot and 4 should be dash. If it works there, try at the pins on the paddle jack. If it works there, check you paddle and cable. If it doesn't work right at the processor, then it will have to be replaced.

597. Question????

Yahoo group: pfr3_group
Date: 2008-11-06 01:07:20 UTC
From: scott.fusilier
Topic: 597 Message: 597

Hello all,

this is my first attempt at building an electronics kit. Everything went well through the first assembly groups and "smoke tests". Continued on to assembly group 3, installed parts all the way to L7. Before L7, attempted to perform tests on U8. I jumped in to counting the pins before doing any research on how IC pins are numbered.....Naturally, I didn't get the proper readings.

At this point everything was functioning as it should (display, keyer, functions, and white noise that went up and down with the volume control). Since I was not getting the proper readings from the test of U8, I disconnected the power from the rig and went to the PC to learn how IC chip pins are numbered.....The rig will not come on at all now.

I have gone cross eyed looking at all my solder joints looking for errors only to find none. I have tested the 24 pin main chip, along with the rest, and have power to all of them......Rig will not come back to life.

Any suggestions?

I would be grateful for any comments.

tnx es 73

OK....I did find an issue. I just tested the voltages on U6,the 28 pin
main chip, and found that I have 5v on pin 1....Good....2v on pin
2....not good....And 0v on pin 3. According to the voltage charts
included in the kit, pin 2 is DDS CLK, and pin 3 is DDS EN.

Thanks in advance for any suggestions.

Scott

601. We're making progress! But....

Yahoo group: pfr3_group
Date: 2008-11-06 06:18:28 UTC
From: k7ddmjb
Topic: 601 Message: 601

Well, I finally got the counter hooked up and mesured the DDS to see if it was working, and it was.
Used my MFJ-259 as a sig generator and discovered the receiver IS working but its deaf. I suspect my winding of T1 is still not correct and unfortunatly after doing this TWICE, and obviously not getting the correct orentation of the wires in the holes correctly I must ask the group a question.
If you go to page 8 of the instructions and look at the picture of the coil winding and then number the wires from RIGHT to LEFT as "start winding'= #1, then "finish winding"= #2, the next loop wire as #3 and the last loop wire on the "Make" side of the description as #4.
From what I can figure the start winding goes in the top left hole marked with an "S" and the loop wire,(#2 called the finish winding) goes in the bottom left hole marked "L". The other two are grounded in the two holes on the right side of the transformer.
IF this is correct please confirm this so I can move on and see what is going on.
We're getting closer.
I also notice it appears that I need a bit more range out of the peaking control on 20 meters but I think I can touch up the trimmers on the back of the cap and tweek it in, (I hope).

602. Low volume

The LM386 data sheet also shows a way to increase the gain by about 8 dB by connecting a 10 microfarad cap (+ to pin 1) in series with a 1.2 K resistor to pin 8. This might be a way to start first and then if you need extra gain then short across the 1.2 K resistor. Part of what we think is not enough gain is due to being used to modern rigs with AGC. In the modern rigs we turn up the volume to a confortable level with noise and then when a signal comes thru it reduces it. Now with no AGC the brain still wants to turn it up the level we expect but with no AGC the signal pops up out of the noise much more. So when you think the voltume is low remember to listen to the signal level and not the noise level. Increasing the gain will also increase the sidetone level.

Use an outboard utility amplifier/speaker (you need one for your bench anyway) such as the Radio Shack Mini Amplfier, a homebrewed version of the same or Jim Kortge's "Islander".

Usual disclaimers apply but the Radio Shack amp. is nice because it has an integral speaker, volume control and battery. Works well for casual listening to the PFR without headphones.

609. Group 2- Smoke test failure

Yahoo group: pfr3_group
Date: 2008-11-08 18:11:43 UTC
From: ea2ctb
Topic: 609 Message: 609

Hello guys,
I am a newcomer to the electronic world, and this is my second kit.
I passed successfully group 1. The LED display works pefectly, and I
can do all the functionswith teh switches.
However, after soldering all parts of Group 2, I can hear nothng at
all. It seems that the paddle does its function, because I can change
speed up or down with teh dot/dash paddle, but tehre is no way to hear
anything at all. No noise, no side tone,...
Soldering seems to be ok, parts seem to be ok, I try different
headsets, adjujst Rx cap, BFO trimmer, ...
I only have DVM to test. No other tools like oscilloscope or frequency
meter.
Any help would be VERY appreciated as I am compelteley stuck.
If you need more info to help me,please, ask me.
regards,
Inaki

The first thing to check is the audio amp, the LM386. Do you have it installed the correct way? The pin 1 dot should be facing "down" towards the display, which is opposite the way the other chips in the group face.

Is there 6 volts on pin 6, the supply voltage input pin and 3 volts on pin 5, the audio output pin?

Hello PFR-3 group,

having some technical difficulties.

Would like to preface with the fact that this is my first attempt at an electronics kit....And if it never works properly, I have still learned a multitude.

Made it all the way through group 1 and 2, passed the smoke tests, assembled group 3 all the way to L7. At this point everything worked as it should, display, keyer, had static in head phones that increased and decreased with the volume control, etc.

Here is where I think I screwed up.....Started the test on U8 with out knowing explicitly how the pins are numbered. Naturally, I got incorrect readings. So, I disconnected the power to the rig and went to the PC to learn about IC chips. I learned that the pins are numbered counter clockwise beginning with the dot. I plugged the battery back into the PFR-3 and nothing happened. The rig has no display, and is inoperable in all respects. I can still hear noise in the headphones, but it is just dead noise.....Not the receiver.

I have since established that the issue is not a lack of battery voltage. I have tested all of the IC's and for the most part, they all have proper voltages except for U6.

Further testing of U6, the MEGA 48 MPU processor, shows it to have 5v on pin number 1, 2v on pin 2, and zero volts on pin 3, and proper voltages on all subsequent pins. I am certain that there are no soldering issues here......I have gone cross eyed double and triple checking every joint on the board......I even re-heated all of them to insure good flow. Also, all the capacitors are mounted properly, long side in the +.

Also, I found the post here about the mistake on the board, pin 7 to pin 20, and sever 7 to 21 path, which I completed after it would not start again.

I would really like to finish the kit on my own......Just need a push in the right direction.

I would be grateful for any suggestions.

Is it possible that I somehow disrupted the flash memory on U6? What about the surface mount stuff????? The reset on pin 1 (U6), does that restart the chip?

Thanks es 73

Many thanks for fast reply Steve.
The LM386 is properly installed, but there is no voltage in any of its pins. From pin 1 to 8, 0 volts.
In fact, every pin of U1, U2, U3 or U4 has "0 Volts".
LED display lights OK, adn the ATMEGA48 processor has voltage in many of its pins.
Any clue? Any other check?
Thanks again

The audio amp and the rest of the receiver chips gets thier power from a seperate 6 volt regulator, U5. This is near the upper left hand corner of the display. Make sure you indeed have the 78L06 regulator installed and not something else! If the proper part is installed, touch it to see if it is getting hot. If so, you likely have a short to ground from the output side someplace.

MANY thanks Steve,
It is solved and smoke test 2 passed with merits!!!
U5 was in place, but with your clue I focused on re-soldering the three legs of U5, adn it seems any of them was not ok, because voltage came to pins of audio amp, hiss appeared, side tone is clear, and reception even without antenna worked!!!
I did manage to listen to a couple of QSOs along the 40 m band, and regulate cap and trimmer.
Again, many thanks for your indications as they led to the solution. Otherwise I could have spent hours re-soldering every lead, and in some cases (what I was afraid of) even would have spoilt some good ones.
I will go ahead with part 3 as soon as possible, and hopefully no need to bother you until the rig works.
Regards,
Inaki

Pat,

Just about any code course will get you there eventually, some are better than others. I really like the Chuck Adams (K7QO) course It's all on MP3's and you can practice any where. Chuck Adams currently holds 8th place in the all time CW speed record book of 140 words a minute at 100 percent accuracy. So he has a pretty good method and is great source of instruction. Here are some links:

OK,
So this being to recognize a call at high speed then after 1 full minute you copy and resend?
Nine years ago I was good for 40 WPM holding a QSO.
But I got hit with a stroke.
Then I started kit building and experimenting with antennas and I lost my speed but I can still bag calls at 35-40 WPM.
Having a local club and a CW buddy really helps out.
OK,
I will meet you at Dayton in 2010 and we'll put Chuck down and wipe the score away from the EU hams:-)
I didn't do the download because i'm on dial up and it seems AOL never gets much over 28-600 here so I been listening to the KOCH trainer.

Send it to Steve.
He invented that rig
He has all the lab gear and for a few $$$$
You get the rig professionally aligned by the person who knows it better
then anyone else

nick_ulman@... writes:

Can the PFR-3 be easily calibrated or adjusted after it's completely
finished or is it better to do that before wiring it into the cabinet?
The reason I ask is that I have only a DMM; no scope or frequency
counter. However, I could take the completed (or partially completed)
radio to somewhere where test equipment is available. 73, KZ2V, Nick

633. Working perfectly

Yahoo group: pfr3_group
Date: 2008-11-21 23:14:31 UTC
From: ea2ctb
Topic: 633 Message: 633

Hello guys,
I finished the toy a few days ago as I posted, but now I can confirm I have worked a few countries throughout Europe (from Spain), and the rig performs as it should and it delivers the right power at every band.
My only comments are:
- I still find difficult to understand the use of S8 (coax-BLT) and rear switch (facing binding posts or BNC) depending on the type of antenna and the use of BLT. If someone could clarify the different options of both switches for hte different cases:
+Coaxial antenna in BNC and no use of the BLT
+Coaxial antenna in BNC but use of the BLT
+Binding posts (dipole or so) and no use of BLT
+Binding posts (dipole or so) but use of BLT
+Other posibilities?

- I find quite tough the recording of messages. Your timing must be very accurate.

You see both comments are not complaints for the rig, but for me hihihi.

By the way, the SWR led gets me "blind" after a while of adjustment and close look at it. Shouldn't it be coloured or less bright? I cover it with a small film of blue plastic to darken it a bit. Do you use any similar trick?

Anyway, a lot of fun and a real usable QRP toy.
Congratulations Steve!

If the toggle switch is wired as shown in the manual, when the handle of the switch is facing the binding posts, the red post is connected to the center of the BNC jack and the black post is grounded. In this case, the BLT now has an unbalanced output. The BLT/Coax switch should also be in the BLT position.

With that switch combination of settings, the tuner can now be used to match coax (using the "Low Z" BLT setting) or end feed wires connected to the binding posts. End feed wires which are shorter or close to 1/4 wave length would use the low Z setting wires close to 1/2 wave would use the high Z setting.

Thanks for quick answer Steve.
I will check if the wiring is exactly as in the manual, and I will try it out. If I do not get it, I will come back to you.

Hi Steve,
What you wrote below is exactly what I can find in the manual under the paragraph "Using the BLT with end feed antennas or coax".
It is OK.
However, there is a note under the paragraph "using the BLT" in the manual that confused me. It says: "The handle of the switch on the rear panel should be slanted towards the coax jack using either balanced line on the binding posts or just a coax feed antenna".

Perhaps in theory both recommendatios might be right, but a bit confusing for newcomers I think.

Hello world
Please, I need your help.

After two weeks that I've assembled my PFR3
and it worked well, one day I turn on and display don't run !!
Hargh !!! I've checked power supply coonections, voltage etc.
All well !!

Double Hargh !!!

Then I've moved band selector and Ta tha ... Display appears.

Every time that I turn on my PFR3 same behaviour.

Please could you help me to solve it ?

Thank you in advance.

fred

648. PFR3 ATMEGA48 Chip Update

Yahoo group: pfr3_group
Date: 2008-12-12 13:49:38 UTC
From: donaldjmcbride
Topic: 648 Message: 648

Wondering aloud here about the current time frame for ATMEGA48 chip re-programming. I understand we are to mail the 28-pin DIP back to Steve Weber and not to Doug Hendricks.

Early in the summer, I built our favorite PFR-3 "Yellow Wonder" and have been using the daylights out of it ever since. I need to get the chip re-programmed, as I have one of the early issue kits without the "red dot" on the chip.

Trying to do without use of this wonder rig for the least amount of time possible, I have been procrastinating the inevitable downtime in order to send the chip to Steve for re-programming. How long has this process been taking?

I really like what Steve has designed. Doug kindly sent me the four additional black thumbscrews to facilitate battery replacement and the rig is near-perfect in my eyes. It creates a stir wherever I take it (and being one of those dummies who lives in an antenna restricted community, portable operation IS my hamming outlet).

Any feedback would be appreciated.
Thanks for the bandwidth.

.. 72/73,
... Don WA3ZBJ/4

I try to turn them around within a day or two of getting them. The mail might be a little slow this time of year, weather might be a factor and if I can get my car to start.

Sorry Bob...but you're obviously assuming that all of the problems were due to design or packaging. Many of the problems were builder errors which happen with any kit. Any problems with the microprocessor were easily and quickly fixed by Mr. Weber and, on at least my radio, volume has never been a problem...but then again, I have good ears. The radio is superb and a joy to use, and if one does have a problem, the support is excellent. It does have a built-in tuner...not automatic tuner. So far as a regular vfo, it doesn't get much easier to use than this. For my money, this is a super piece of equipment! Steve N0SM

Sorry Bob...but you're obviously assuming that all of the problems were due to design or packaging. Many of the problems were builder errors which happen with any kit. Any problems with the microprocessor were easily and quickly fixed by Mr. Weber and, on at least my radio, volume has never been a problem...but then again, I have good ears. The radio is superb and a joy to use, and if one does have a problem, the support is excellent. It does have a built-in tuner...not automatic tuner. So far as a regular vfo, it doesn't get much easier to use than this. For my money, this is a super piece of equipment! Steve N0SM

Hi Bob,
If my information is correct, in one run the wrong caps were included. That's one of the pitfalls of purchasing a kit. Having helped to assemble even a small, simple kit, it is very possible to get the wrong parts in. The fact remains, though, that they were replaced. The programming problems with some of the chips was handled with dispatch and the radio is super. It is VERY easy to have small glitches appear and the more parts that are involved, the greater the chance. If one expects perfection, building from a kit isn't the way to go. A recent case proved that. The Norcal 2N2-XX (x being frequency band) was designed, beta built and exhaustively tested. On one run of the unit, some of the newly purchased parts had the correct designation but caused the radio to drift like a log at sea. The designer tried to simulate the situation and couldn't so with the help of one of the people who had received a drifting kit, he determined that the toroids and a trimmer cap had been purchased from a different supplier and were different enough to cause it to drift. Once the correct parts were put in, it was rock stable. The radio had been built and tested many times but far from the control of the designer, the parts made the difference. Like I said, it is a great little radio....far more sensitive than any qrp radio I've ever used. It works like a champ.
All that said, I certainly can understand your concerns. One wants to build the radio and have it work or at least if it doesn't, find out that it was one's own mistake!! In this case, however, the support was readily available and a fix was made in very short order. 73 Steve

Hi Bob and All,

I have three links here you might enjoy concerning the PFR-3. The first is a good review of the rig by Dr. Bob Armstrong, N7XJ, for whom this radio was originally designed. The second is a video of Doug Hendricks on the development of the PFR-3 from the Williams Arizona QRP forums last summer. The third is Dr. Bob's presentation video on his experiences with the radio on a backpacking trip for field day. The two videos are from the Arizona ScQRPion forums. They are 45-60 minutes in length each. One is about 45MBytes and the other a little over 50 Mbytes.

The concept for the radio was taken from a presentation by Dr. Bob at the 2007 QRP forums and in full production before the 2008 forums. I hope you enjoy them.

http://arsqrp.pbwiki.com/Impressions+of+the+Hendricks+PFR3

http://www.azscqrpions.org/PFR3HistoryWeb.wmv

http://www.azscqrpions.org/PFR3FieldWeb.wmv

There are three other links from the Williams Forums that also may be of interest, but are not related to the PFR-3. This set of 5 videos constitute the entire program of the Williams Arizona QRP Forums for 2008. We will likely move to Ft. Tuthill near Flagstaff for the 2009 campout and forums if everything goes as planned. Oh. Yeah, this IS an invitation to join us on our tentative date of the first weekend in August 2009.

Now enjoy the vidos compliments of our most generous and interesting speakers and videographer, Mark K7MLC...

Circuit Design using a Circuit Simulator (Tom Keuhl AC7A)
http://www.azscqrpions.org/CircuitWeb.wmv

Design of the Clipperton DXpedition Vertical Dipole Antennas (Paul Playford W8AEF)
http://www.azscqrpions.org/ClippertonWeb.wmv

QRP Contesting (Dale Martin KG5U)
http://www.azscqrpions.org/ContestWeb.wmv

These links will be made available on our website as soon as I get time to do some fairly extensive revisions concerning FYBO 2008 & 2009, Williams, Paddles (new one) etc.

Hi PFR3ers,

If this can be of some interest, just wanted to let you know I operated the yellow box last saturday, outside, at 5 degrees F, yeah, pretty cold, and the radio did its job flawlessly.

Again, congrats to Doug and co, this thing is really a FB FB rig.

Hello.
To have some fun I take with me an electrical wire 1mm2 10 m length and
a magnetic balun 9:1.
With this simple system you cannot compete in a WW contest, but it is
very portable and I manage to get out in every band and make many QSOs.

From: Warnier jos
Topic: 670 Message: 670

Dear PFR friends (since this whole yellow box affaire started ,
made already some good friends here hi!)
A few months ago,started a new (much more difficult) project:
trying to make as original as possible :
the Whaddon MKVII "Paraset" WW2 Spy transceiver... but meanwhile a
bit wondering how such RX and TX would work (in fact , it's turning
the clock some +/- 65 yrs back)
so I made another "PFR transceiver" hi!
a "Paraset Fun Radio" for 80 meters only, with digital dial (as I
did not erased any info on it ;-))
pse note : this is not a replica or whatever,NO just a simple funny
Xtal-TX and a regen.RX

the schematic can be found on many Paraset-websites
for the 6V6, I used a EL84
for the reaction a EF89 instead of the 6SK7
for the audio a EF80 because having a lot of those old B&W
television IF tubes ....

I put some foto's :
http://www.flickr.com/photos/28834875@N02/

Best wishes for 2009 to all,
and hope to make 2x PFR contact's as possible
(will also be QRV during the "Winter Sports 2008")

Topic: 666 Message: 671

Hello friends,
No secret at all.
The coax output (BNC) of the rig goes to the coax input of the magnetic balun (usual PL connector). The wire (10 meters or more) from the balun to the nearest tree. You then tune with the BLT of the rig.
I get resonance easily (turning the knobs slowly and carefully ...) in every band.
The balun is a commercial WIMO- MTFT, but anything reducing the impedance of the long wire should work. This is a 9:1 ratio. I also tried a 4:1 and it worked but made tuning much more difficult or even imposible.

Perhaps adding a counterpoise (another long wire or a connection to a steel mass) to the steel plate of the balun might help increasing performance, although I did not try.
See this link for the balun: http://www.wimo.de/wireantennas_s.html and look under the paragraph: "MTFT Balun Magnético" (there are 2 models equivalent.

Again you do not compete in a WW, but in 2-3 sessions I already collected 20 entities all over Europe having in mind that 20m is dead these days. I even made some QRP-QRP QSOs
Good luck.
Iñaki

... and a huge advantage is that it makes the system really portable.
The rig, the wire 10-20 meters (choose one of these covered with
silicone instead of PVC as they are more flexible and easy to pack), a
set of batteries 8xAA, the balun, the mini-paddle and the small
headphones .... get into a 30x30x6 cm box.
If I can help more, tell me.

<http://wa3wsj.homestead.com/BW.html> I have been using using
WA3WSJ's version of the Crappie fishing pole wire vertical antenna. It's
three band design matches the rig. I've used it on the trail and on
weekend trips where it sometimes is used on a second floor balcony. It;s
a nice performer on high ground and near the water. It's easy to make .

From: Mecsr
Topic: 676 Message: 676

I built the BSI, calibrated it and installed it in the PFRe. all tests so far indicate everything is OK!!
I did have to,(literally) take the Unit apart in order to get the BSI installed,was a lesson in staying calm and thinking things out. I have batteries installed and am running unit now on batteries to make sure that the status indicators are still working ok.

To All:
I think the battery indicator is a wonderful tool. However, I am red and green color blind and thus it is not much help. I think I have found a method that is just as effective for me. I use a small MFJ-904H "Travel Tuner" with Cross-Meter. (I don't back pack) When the voltage drops off so also does the power and this is seen as a loss on the forward power meter. Today I had the pleasure to "throw" a wire over a tree, lay out a counter-poise and fire up the little yellow box. The best part was watching my 8 years old grand son as things were connected, wires attached and CW came out of the Radio Shack amplified speaker I was using. That was the greatest thrill.

I tuned the MFJ for maximum noise in, or signal, then slowed the CW down to 5 WPM. Then by pressing the dash paddle I could quickly tune the MFJ.

What do you mean, "final calibrating of the coils"?

I have just finished building a PFR3 and don't remember anything about
"calibrating" coils. Please explain.

Thanks.

With the encouragement found from members of this group, I sent my
chip in on Friday and it is back already! That's less that a week
including postal time. Color me happy too!

The built-in tuner is so much easier to use now with the "Tune"
function operational and the memory keyer is now 100% -- or as close
as it is going to get with this operator. <grin>
Thank you, Steve!

696. BLT Antenna Tuner Problems

Yahoo group: pfr3_group
Date: 2009-01-19 18:05:46 UTC
From: Bill Rodgers
Topic: 696 Message: 696

I found a surprise with the PC board used. I bought mine in Dayton in 2008. Evidently one (or all) of the holes are not plated through. I soldered the BLT toroid to the top of the board (because it was easier). Unfortunately, one of the connections did not make it to the bottom of the board where the traces are. I then cleaned off some insulation from the windings and carefully soldered under the coil.

An easy check to see if this is a problem is to check for a short circuit between the terminals of the balance ant connector. There should be a short for Hi-Z and Lo-Z BLT settings. I found that my Lo-Z showed an open circuit. The toroaid primary is easy to check on the correct leads on the BLT tuning cap. Good luck, 73 Bill K3HZP

697. PFR3 operating at -12 F (-25 C) and an idea for next summer

Hi PFR3ers,

Your yellow box will work even in very cold temperatures. Watch this:
http://www.youtube.com/watch?v=0TJKAjuXC3c

Now, somebody mentionned this idea couple months ago, and I am launching the subject again. What about a sort of PFR3 gathering on the air. I mean, kind of a PFR3 qso party but this wouldnt be a contest, only a meeting of PFR3 on the air? This could be a great experience. Something long enough to have the slightest chance to contact our friends in Europe.

Could be fun to do this like next summer. What do you think?

698. Low Audio Output on the PFR3

Yahoo group: pfr3_group
Date: 2009-01-20 01:58:30 UTC
From: w5jhjerry
Topic: 698 Message: 698

I just started using PFR3 and I find the audio output to be low. In discussions with Dr Bob Armstrong, he confirms the problem with his PFR3. Has anyone made any mods to increase the audio output? I have 5 sets of earphones. Two of these sit on the ears and are most confortable. One is an off brand that has 102db sensitivity and the other pair is a nice pair of Koss headphones with a sensitiivity of 106db. The Koss phones are ok but still not enough volume for out of doors operation. I also have 2 forward firing in-the-ear type with a small headband. One is folding type from Radio Shack. I don't remember the sensitivity but they have the best volume. The second pair of forward firing type are Sony brand and they are so-so. I have not tried my most sensitive type (the "Plug" by Koss) because they are very uncomfortable to me. They just stretch my ears way too much. So, I am left wondering what I should do. Does anyone know what headphones Steve designed this radio for? It appears the PFR3 needs 110 to 112db sensitivity minimum to get reasonable audio. I may look into designing a small headphone amp to cure the problem but that will defeat the purpose of the radio. Everything was to be builtin. I don't really want anymore "dongles" hanging off the radio.

Jerry:
I had the same problem you speak of. Worse, I am hard of hearing. I made the mod discussed by Dieter OE6WTB on October 29, 2008 with an attachment showing the mod. He put a 10 uF 16V cap at U4, the LM386. (+) to 1 and (-) to 8. This really works! My cap measured 14 uF and it worked fine. However it is a bit fat for the batteries, so I am looking for a smaller one at the same value. Mine was rated at 100V instead of 16 V that Dieter used, so bigger.

Also, Radio Shack has an amplified speaker and it works well. Also, I just got a amplified speaker made for an iPod and this works well. In the shack I have a head sets that have a bit of amplification and these too help.

Good Luck! 73

Hello Paul,
I first tried the 10uf/1200ohm combination mentioned on this list. However, the gain was not enough. So, I have tried the 10uf cap, the same as you. It now has plenty of audio. The only problem now is that the sidetone needs to be tamed down a bit. In looking at the schematic, it appears R14 could be increased or C27 decreased or maybe both. Another fix might be a resistor from the junction of C27 and R14 to ground. I will play around with it a bit tomorrow to find a good combination to lower the sidetone. Anyone have a fix for the increased sidetone? Maybe it has already been discussed?

10 ufd is a bit of overkill for increasing the audio, a 1 ufd or even 0.1 ufd is likely enough. However, a better, but a little harder to do as you need to take the board out of the box, is to increase the value of R6 and R9 from 330K to 470K to give the 1st audio stage more gain. Doing it that way will keep the sidetone level the same and keep strong signals from be way too loud.

Steve,
To keep from removing the board from the case and to keep from desoldering the two resistors suggested, I make a different mod. I added a 1uF/50v electrolytic from pin 1 (+) to pin 8 of the LM386. That mod gives plenty of gain. I also added a 470K ohm resistor from the junction of C27 and R14 to ground to tame the sidetone. I have uploaded a picture in the photo section to show the mods.

Hi just wondering is there a difference between the red side and the black side of the torrid? The reason I ask is because I was always taught to hold the colored side toward you and holding the torrid so that the wire is fed into torrid at approx the 5:00 position and wind counterwise as many turns as you need to. IS THAT NOT CORRECT? I saw a picture in this group where the the person was holding the torrid with the black side, toward the winder, and being started at the 12:00 position. IS THERE A DIFFERENCE?
KINDA STUCK HELP!!!!!

It didn't matter when I built the k2. The main thing is how many
times the wire is going through the middle on the wrap. It is
important to wind in the same direction when making a transformer!
(Meaning, when you use two or more different wires through a toroid.
Spacing of the windings can make a difference too. Usually keep it
evenly spaced unless otherwise directed.
But I'm no expert, and I haven't built this kit yet.

Hi Dewey.

I can't give you a specific source, but the diameter you are asking about (.030) is just below the AWG standard 20 Gauge wire (0.032" diameter.) By the way, #24 wire is spec'ed at .0201" diameter) I don't know what your application is, but for toroids (note spelling) the 20 guage is closest to what you are asking about.

Good luck,
Bruce N1RX

Topic: 718 Message: 718

Hi All,

I'm new to the group and just ordered my PFR-3 Kit!

Just a quick question regarding possible mods to the kit.. Is there anything worth doing as I build the kit. I note there is an audio output mod, and wonder whether this is worth doing at the time,or should I just wait and see after it's built!! Also wonder whether there are any others worth doing..

I also noted from old posts that there may be a 'thumscrew replacement kit' for the case screws, for rapid battery removal. Is this still available??

It's been a while since I've build anything and looking forward too it. I have built a couple of K2's and a KX1, so imagine this shouldn't be too challenging!!

Last question, I send code with the dot and dash reversed (I'm not left handed, it's just the way I tought myself). Looking at the documention for the paddle I think I can simply rewire it?? Is this the case??

Regards All

David, VK2NU

719. PFR3 - Winding T3 Instructions

Yahoo group: pfr3_group

From: kb2rte
Topic: 719 Message: 719

Hello to all,

I am in the process of assembling the PFR3 and this is my first experience winding coils. I am having a terrible time understanding the instructions for T3. I was wondering if someone could offer more clarified instructions on how to get this accomplished. Pictures would probably help too!

Thanks to all in advance,
Richard Dale Fennell Jr -- N2IU

Topic: 719 Message: 720

actually the instructions are vey clear and the picture showing each winding in a different color is the best way to show it.

the only one mistake I know of is where the instructions say to cut a 2 " wire for the center tap connection and says it is turn 8, well that is incorrect and should say turn 6, which is actually the center tap of the first winding.
if you wind it exactly as shown in the picture, it will be correct.

Hi Doug,
no problem at all for the delay,
due pc crash here have lost all data ,yes... no back-up ;-)
for the moment I have only these names&addresses of
DL2BQD, Dieter
OE6WTD,Dieter
G0AZS,Marc
but I think there will be other OM's interested
(as I do)
as written before , to make life a bit easyer for You , gladly will
distribute these sets of screws to the EU-PFR-fraternity
(but do not have an idea how many of these yellow boxes crossed the
pond)
(again: no financial interests here , cost of postage will be only
the effective charges :+/- 0,50 Euro !)
best 73's

My antenna switch on the PFR-3 (back panel) was band when I assembled the kit. Not sure if I used too much heat or it was bad initially. I got one at Radio Shack for $4, a little salty!

The plastic used in the toggle switch melts very easialy. One must be very careful not to let the tab move when soldering. Why they use that kind of plastic is beyond me. I've ruined more then one myself.

Also, my PA went out. Has anyone else had PA problems? I don't know how to protect the PA when my antenna wire waves in the wind at my temporary operations at motels and campsites.

High SWR can cause the current into the PA to exceed safe limits. No good solution, other than to run at lower supply voltages or make a current limited supply that cuts out at about 1 amp.

My BLT tuner does not seem to match some loads close to 50 ohms. I used the turns specified in the writeup 11.5ct, 6, and 2 turns, not the ones in the schematic which were 16ct, 12, and 6 turns. Any mods been suggested?

Nature of the beast. The BLT can't match an infinate number of impedances.

72, Steve KD1JV

Hi,

I have just finished building the pfr-3 kit and I purchase a MFJ-816 wattmeter/swr meter to be able to check out the output of the radio. When I key the radio I can hear my signal on my general coverage receiver but there is no deflection on the wattmeter. I tested it with a Yaesu FT-890 and it works just fine.

When I built the kit all the smoke tests were right on the money. Would anyone have any ideas why I appear to be getting no appreciable output from the radio? Are there more tests I can do? Are there adjustments I should make? I would appreciate any advice anyone mught have to offer. I really like this kit and am eager to use it with its full 5 watt output.

Thank you very much,
Richard Dale Fennell Jr -- N2IU

the PFR-3 has a built in dummy load and antenna tunner which should give you a indication of rf out put, are you setting everything up correctly ? do you get the led to light up on the PFR-3 ?

The led does light up when it is in the tune mode position. I have not tried hooking it up to a dummy load. I was hooking it up to a G5RV JR and I also tried an end fedz 40/20/10 antenna. Like I said I can hear my signal on a general coverage receiver but see no deflection on the meter.

Thank you for your assistance,

Richard

Double check the wiring from the RF Output on the pc board to the BNC
connector. It sounds like the power just isn't getting to the BNC.

George is right,

If the switch is facing binding posts, the bnc is selected as output.

If the switch is facing the bnc, the balanced line output is selected
as output.

A added note here. I did not like the way the switch was wired per the manual. So I rewired mine the opposite way. Therefor my switch handle points to the output connection being used. Made more sence to me! 72 George/W2BPI

Hi all,
The more I use this little rig, the more I like it! The receive selectivity is outstanding, particularly the skirt selectivity. The receive sensitivity is very good. I find the user interface
to be excellent, especially the ease with which I can change my sending speed. And I like the
feel of the paddles. I do wish the rig had a bit more audio "oomph", but I found it to be sufficient with a sensitive pair of headphones. Also, I have a little Radio Shack amplifier/speaker, which when used with the PFR-3 can blow me out of the shack <g>.
I racked up about 30 QSOs in the 2008 Swepstakes in a couple of hours operating. I worked some DX with the rig and used it in FYBO 2009.
I do need to get more accustomed to the BLT tuner, but the Load control broke free while I was using the rig in FYBO 2009. So I'll have to get in touch with Steve, KD1JV.
While initially I was a bit dubious about the PFR-3, I've since decided that it is indeed a keeper!
72/73,
Cal K4JSI

PRF vs FT 817 RX
What rig has less RX noise?
Also can the tuner be left out and an end fed built in?
Are orders being taken now?

741. BNC / Binding Posts Switch

Yahoo group: pfr3_group
Date: 2009-02-09 18:09:38 UTC
From: pablo kiryluk
Topic: 741 Message: 741

I use the swith *always" in the same position, either with the coax output or the balanced line. I have used both output without moving the switch with no problem at all

I believe the switch *only* grounds the black post when you use a long fed wire...

Am I mistaken?

it may just be that the shaft screw came lose, remove the knob and tighten the screw, then replace the knob.

a small drop of lock-tight on the threads may prevent that from happening again.

The manual suggests using a drop of super glue. I have done that
on all my projects that use these type of caps. 72 Geo/W2BPI

There is a order form on his website. I think the May ref was for when the kit was first introduced. I don't have a FT817 so can't compare them. I built a PFR-3 and am very pleased with it. I have used it a lot and believe it is a great buy. Just my 2cents. 72 George/W2BPI

751. My PFR-3 Further Comments

Yahoo group: pfr3_group
Date: 2009-02-10 20:03:46 UTC
From: Cal Cotner
Topic: 751 Message: 751

Hi all,
First, let me thank those who responded with suggestions about the Load control on my PFRR-3. WB7DMX nailed it - the shaft screw had simply loosened, I tightened it, which solved the problem. I'm contemplating the various approaches to increasing the audio gain that were suggested, and will decide on which course to adopt. It appears that my posting triggered a good deal of discussion on the list, which I hope folks found interesting. I've certainly found this mail reflector to be a valuable resource!
Regarding the pushbutton tuning mechanism, I find that it works just fine, and I don't miss having a tuning knob. I got used to pushbutton tuning on a Swan/Cubic Astro 150A and it worked fine, as well. Don't let the pushbutton tuning on the PFR-3 put you off.
I'll close by saying again that the user interface on the PFR-3 seems well thought out to me, and I anticipate a lot more enjoyment from this fine little rig "as time goes by".
72/73,
Cal K4JSI

752. New PFR-3

Yahoo group: pfr3_group
Date: 2009-02-11 13:30:45 UTC
From: vk2nu
Topic: 718 Message: 752

My new PFR-3 is built and on air. Even managed a first QSO, with V8FHX, whilst I was adjusting the paddles.

I have 4-5 watts out on all bands and RX seems Ok, although I haven't realy made any adjustments.

I managed to wind T1 wrong (counter clockwise with the wire coming up through the core, not down as instructed!!!). this mean't that the holes were not aligned and I had to be creative when threading the leads through the pads. When I can get some extra 30# wire i'll rewind this.. Still works Ok, but looks messy.

T3 doesn't look very tidy either, and I may rewind this later??

All good so far, I'll do some tweaking and install the battery compartment tomorrow..

David, VK2NU

Bob

Noise of the PFR-3 is likely driven by the DDS chip used (data will be on the manufacturer's data sheet) and the clock source used to drive it ... I expect it to be similar to other QRP rigs that use a DDS. Perhaps the ARRL lab will check it out (i did ask when it came out!).

The manual tuner is essentially a stand-alone function -- so it could be customized to what the PC board can host -- note manual is available so you get the info needed to consider your desired mod.

Actually, most of the noise is from the product detector chip. If you short out the input to product detector, you will not notice any significant change in the noise level, which is actually not much to begin with.

755. PFR-3 Almost complete

Yahoo group: pfr3_group
Date: 2009-02-21 18:07:41 UTC
From: ai4rj
Topic: 755 Message: 755

The build went smoothly for the most part and likewise for the quality of the components. One of the screws for the polyvaricons had no threads but was able to find one in the junk box. (I'm one of those people that never throw anything out)Both of the binding posts had bad threads and were unusable.... again, two from the junk box. Everything else was fine. All of the tests were fine and did the alignment with a freq counter and scope and seems to be dead on frequency. The receiver and filtering is excellent even in contest conditions. Power out is 5 watts on all bands.
I did the final tests and mounted everything in the case last night, plugged into my 137' OCF dipole and worked Y0TA on the first call. Second Q was with HG7T .... had to repeat call once. Both Q's were over 1000 mi per watt so I'm satisfied.
Looks like this radio is going to be a lot of fun this summer. Thanks Steve and Doug for a very nice kit.

I built one of these kits. I did not have any trouble with the kit. All parts were good. If you can follow instruction as given in the manual you will wind up with a great rig. I use mine at home and in the truck camper with a Hamstick dipole. Many great Qso's. Be careful when building and double check your work. I am not an engineer or electronic technician. But I can read and follow instruction. GO FOR IT AND HAVE FUN!!!!!!!! George/W2BPI

No, Emory. Defective parts are not common with this kit. The part
that has been a little troublesome has been the microprocessor and while
it is a bit of a pain to have something that volatile go out, it "ain't"
the end of the world. Mr. Webber has been very good about replacing
them and, in fact, has been very good about helping people troubleshoot
their units when help was needed. While I have not had the time to use
mine extensively, it works like a champ and I look forward to taking it
with me on trips this summer. It's a neat kit to assemble and with the
exception of one part (toroid) for me was a heck of a lot of fun to
build. Parts are hard to come by in many communities. That's why
there are places like Newark, Mouser, DigiKey, etc etc who give
excellent service, are available online, and, while I'm sure they prefer
commercial orders, are still willing to serve the small guy. Quit
worrying about part, order the darned kit, and get started with the
fun!!!! Steve N0SM

The defective parts were only the threads on a couple of screws. When buying things like that in bulk, I find it is common to have a few not perfect and you will never know until it is time to actually use them. The rest of the kit was first class. Im sure if I had asked for replacements, Doug would have sent them but I did not see the need since I had them and wanted to finish and get on the air. All the kits from Hendricks are first class and they stand behind them 100 percent. Order your kit and it will amaze you when you start making QSO's.

Emory,

Buy the kit and have the time of your QRP life. Doug's kits are first rate and I had even put my $200.00 down sight unseen before the kit was available last spring. I picked it up from Doug himself at Dayton and had a friend build it (my building time is limited) and it worked right from the first. Any problems with the first few kits were discussed and mods were made from all the first kit builders on this site during the first three months. Deiter even has photos of his assembly giving you step by step in pictures. The directions are now even better than the Heath Kits of old. Go for it! Enjoy. See you on the air.

765. My PFR-3 is off the ground

Yahoo group: pfr3_group
Date: 2009-02-23 20:44:18 UTC
From: Charles R. Pfister
Topic: 765 Message: 765

Greetings to my fellow PFR-3 owners and future owners.

I started building my Yellow Radio last night.
Under the helpful and watchful eye of my kit-Elmer, WD8AXA, Chuck,
we completed Group 1 assembly and test successfully.
My goal is to have working my Portable Field Radio to take to
Hamvention '09.

I've used another PFR-3 for a QSO, so I know how much fun the rig is.
It is easy to forget that it was once a kit of parts, because IT IS a
portable, small, precision CW transceiver.

766. New paddle for my PFR-3

Yahoo group: pfr3_group
Date: 2009-02-26 22:49:27 UTC
From: Jerry Haigwood
Topic: 766 Message: 766

Hello All,

As some of you know, I sell paddles. Recently, I built a paddle for my PFR-3. I call it the Baby Black Widow because it is based upon the Black Widow paddle I currently sell (see www.w5jh.net/black_widow.htm). It is 2 inches wide by about 3 inches long and weighs a bit less than 8 ounces. I am making three prototypes. Dr. Bob Armstrong - N7XJ, the person the PFR-3 was originally designed for, has one. I am building one for John Stevens - K5JS and I will keep the third one. The paddle attaches to the front of the PFR-3 just like the paddle sold by Doug Hendricks. I am planning to make a bracket so it will also attach to the front of the Elecraft KX1 radio. The paddle has dual ball bearings for each arm just like the Black Widow. A nice feature of this paddle is that it can be used as a standalone paddle also. All you need to do is add a 1/8 inch female to male stereo cable. You can then plug it into any of your other radios. I have not decided if I will make this a standard product. I will first need to see if there is any demand. I have uploaded a picture of the paddle to the picture section of this list. If you think you would be interested in a paddle like this, let me know.

Mike,

I expect the paddle would sell in the $40-45 range.

I would be interested in one... any idea what the price range will be on them?

On Thu, Feb 26, 2009 at 4:49 PM, Jerry Haigwood <jerry@...> wrote:

Hello All,

As some of you know, I sell paddles. Recently, I built a paddle for my PFR-3. I call it the Baby Black Widow because it is based upon the Black Widow paddle I currently sell (see www.w5jh.net/black_widow.htm). It is 2 inches wide by about 3 inches long and weighs a bit less than 8 ounces. I am making three prototypes. Dr. Bob Armstrong - N7XJ, the person the PFR-3 was originally designed for, has one. I am building one for John Stevens - K5JS and I will keep the third one. The paddle attaches to the front of the PFR-3 just like the paddle sold by Doug Hendricks. I am planning to make a bracket so it will also attach to the front of the Elecraft KX1 radio. The paddle has dual ball bearings for each arm just like the Black Widow. A nice feature of this paddle is that it can be used as a standalone paddle also. All you need to do is add a 1/8 inch female to male stereo cable. You can then plug it into any of your other radios. I have not decided if I will make this a standard product. I will first need to see if there is any demand. I have uploaded a picture of the paddle to the picture section of this list. If you think you would be interested in a paddle like this, let me know.

Hello Jerry, I would VERY much like to buy one of your baby paddles. I tried for a few months to use the Hendricks attached paddle but just did not like the feel. Put me down for one and where to send the money order.
Thanks

Jerry, if you can get them out soon enough I will take one to FDIM for show
and smell.
I have the stock key also, but have enjoyed my other paddles you designed.
The Sqrpions
paddle is my usually field paddle for setting up in the park.

Johnny,

You should be able to do that. The only problem being you will need
to change the front bracket and add a connector for the 2 wires (dot/dash).
Three screws hold the front bracket onto the paddle base.

I paid for mine on 6 Feb and haven't received it yet either. I thought the shipping time was 1 to 2 weeks but I guess not. I called them up last week and he said he either shipped it out Monday (two days earlier) or it would ship out that weekend. I guess it dodn't ship Monday or I would have had it by now.

I know a lot of QRP kit sellers run their companies as a second job after a full day at their real job, so I don't mind waiting. I just wish they had something set up so you knew where you were on the list like Dave Benson does.

Stewart and Bill, both of your rigs will ship tomorrow. I am a 1 man operation, and am still a full time teacher and high school basketball coach. Thus, I do Hendricks qrp kits on weekends. I lost the last 2 weekends. 2 weeks ago I got the flu, then I had an abscessed tooth problem that took 3 days and hours in the dentist's office to fix. I was able to get part of the back log addressed and ready to go to the post office today, and will take another load tomorrow.

I apologize for the delay, it was unavoidable. Thank you for your patience and understanding. Hopefully by Friday I will be current on all orders shipped.

72, Doug

Thanks, Doug, I had a feeling it was something like that, hope you're feeling better. Looking forward to it, and I also have the workbench cleared off here in anticipation.

791. Group 1 smoke test Question

Yahoo group: pfr3_group
Date: 2009-03-05 15:02:50 UTC
From: Joseph
Topic: 791 Message: 791

Hello all,

I am building my PFR-3 and am at the first smoke test section. I have a question about the last bullet in that group of tests:

The DDS chip should also be working at this point. This can be tested with a frequency counter connected to the R39/R41 junction at U7 or general coverage receiver tuned to about 2.115 MHz (+/- 1 kHz) with a short pick up lead for an antenna placed near the DDS chip (U7).I am wondering, should R41 be C41?

Thanks for any help you can give here.

Regards and 73!

Joseph

Mine came today, too! Outstanding! I wasn't expecting it until Saturday at the earliest. If only there wasn't a contest this weekend. I may have to call in sick tomorrow if I can get the parts inventoried this evening :-)

Topic: 795 Message: 795

Hi all,
I am at the point of mounting switches S1-S4. In order for the switches to protrude the proper distance through the panel, do I straighten the pins and let the switches sit directly on the board or, should they sit up from the board?

I went ahead and mounted these switches firm to the board and I'm happy
to report that "SMOKE TEST ONE" was a resounding success.
A test fit to the box indicates the switches protrude just fine.

Stewart,

How's it going on the kit? I have three more parts to install, T3 (the last toroid with three separate windings) and two poly varicaps.
T3 is turning out to be a bit of a bear, so I set it aside last night and figured I would finish up tonight. I'm missing the varicap mounting hardware and a 68p capacitor, but I think I can jury rig something until the missing parts come in the mail. I've passed all the smoke tests so far and am really anxious to get this thing on the air.

798. Voltage on U8

Yahoo group: pfr3_group
Date: 2009-03-09 23:44:07 UTC
From: bwmiller262
Topic: 798 Message: 798

I'm having a great time putting together my PFR3, but have come up with two questions:

First, in the Pretests of the Transmitter section (pg. 10 in the instruction manual), while testing the voltage on the L7 pad, it indicates that the voltage should be about the same as the supply voltage to the board. I am using a 9V battery with a measured voltage of 8.3 volts. My voltage across the contacts of L7 is 5.9V and 7.9 when measuring against ground. Is this ok?

Second, in this same section, I got to the following instruction:

"With the transmitter keyed, check the voltage on pins 1 and 13 of U8 again. These should not read about 2.5 volts. Since these pins now have a square wave at the transmitter frequency on them, exactly how a DVM responds to this signal may depend upon the particular DVM used."

I tried both my DVMs (both cheap ones) and have a reading of 0V on both. Do you think there's something wrong on my board or is this a function of my DVMs?

Thank you very much for any help you can offer.

I checked the voltage across the L7 pad closest to C57 and it was 8.5. My supply voltage was 9.2. I can't remember what voltage I got on the other L7 pad, but yours sounds OK.

That doesn't sound right to me. Are you getting a sidetone in the headphones when you key the transmitter? I guess I would start by checking the value of R37 and checking all the pins on U7 and U8 to make sure they aren't bent under and actually go into the socket.

Hi Bill,
Looks like you're a bit ahead of me. I have finished winding L1 and T1
and will mount them today. Then I'll be ready for "smoke test 2".
Did you get the Nylon washers listed in the manual? I didn't get them
and haven't found what they are used for. I think the varicaps mounting
hardware was just loose in the hardware bag. I'm using the six small
flat washers (as spacers) and the very short #4 pan head screws for
mounting the varicaps. Without the spaces the varicap shaft seemed to
bind on the pcb.

Hi, just a word to the wise... from the not so wise... be sure you slow down and read and follow the directions on T1. It is a little different from transformers I have wound in the past. The rig is awesome when completed. It is amazing that you can build such a neat multi band rig with this few parts.

When I did that test WITHOUT the IC installed, I got same on pad 1 and pad 13. Not sure if you are intended to install it first or not. I was using a 9v battery and got 8.3v. You are probably fine.

I didn't get any nylon washers either so I went out and bought some. However, the very short #4 screws are too short to allow both to screw into the capacitor at the same time. I can get one screw to go in without a nylon washer, but it makes the capacitor lopsided. I went to several hardware stores but couldn't find longer screws that would fit. The very short #4 scres were the only ones that would screws into the capacitors, there's some longer screws in the kit, but they have a coarser thread pattern. I have just one screw holding the capacitor in place for now, I will wait until I get them mounted right before I put it in the case.

I mounted T3 last night and wired in the BNC connector and tested the transmitter this morning. I got output on 20 and 30 meters but zilch on 40 meters. That may be because I put an 80p cap in in place of the 68p capacitor in the 40 meter filter circuit but I'm going to check for a bad solder connection tonight, my thinking is even with the wrong cap, I should still get a little juice out on 40 meters. I'm getting less than 1 watt out on 20 and 30, but I wound the toroids as tight as I could; I figured it would be easier to spread them out then to compress them when it comes time to space the turns on the toroid to get 5 watts out. Hopefully, that is all that will be needed to bring it up to 5 watts on those bands.

Mike,

Yes, reading the instructions for T1 threw me for a loop. On first readthough, I thought the two windings were going to be intertwined like T3 is, but the way I ended up winding it was to put the 5 turns in the space leftover after winding the 40 turns as tight as I could. This let the leads for both coils line up with the holes and it seems to be working.

I read through the instructions several times because I wasn't sure whether to install U8 before the smoke test or not. I read through the rest of the instructions and at no point does it tell you to install U8, so I went ahead and installed them before the test. After reading the schematic this morning before answering Bruce's message, I realized pins 1 and 13 are logic gate outputs, i.e. no chip installed, no ouput voltage. I'm hoping he just didn't have the chip installed, that would explain why he was getting no voltage when keying the rig.

but I wound the toroids as tight as I could; I figured it would be easier to spread them out then to compress them when it comes time to space the turns on the toroid to get 5 watts out. Hopefully, that is all that will be needed to bring it up to 5 watts on those bands.

The LPF toroids need to be wound with the wire evenly spaced around the core to start, then only minor tweaking of the spacing should be needed to get 5W out.

Bill:

Thanks for your suggestions. I've checked R37 and the U8 socket and everything is as it should be. I've also done an inspection looking for problem joints but found none. And all other previous tests have passed.

Do you believe it's possible that my inexpensive and simple DVMs are not capable of picking up the square wave being generated? Any other thoughts or suggestions?

Thanks Bill & anyone else who would like to chime in.

You were correct--I did not have the chip installed (per my reading of the instructions). Once the chip was installed, everything measured as it should. Apparently, the instructions should direct you to insert L7 BEFORE testing the keyed voltage on pins 1 & 13.

Thank you very much for your help--problem solved.

See you on the air soon,
Bruce, K7EY

>
> I read through the instructions several times because I wasn't sure whether to install U8 before the smoke test or not. I read through the rest of the instructions and at no point does it tell you to install U8, so I went ahead and installed them before the test. After reading the schematic this morning before answering Bruce's message, I realized pins 1 and 13 are logic gate outputs, i.e. no chip installed, no ouput voltage. I'm hoping he just didn't have the chip installed, that would explain why he was getting no voltage when keying the rig.

Thanks, Steve. I now have the toroids evenly spaced around the core and the output came up a little, but I'm still only getting 1 watt out on 20 meters and only about 100 milliwatts out on 30 meters so something else is going on. Receive sensitivity is egreat on both bands.

Double check the number of turns on the toriods. For some reason a lot of
people forget to count the first time the wire passes through the hole as
turn 1 and end up with an extra turn. Also make sure they are in the correct
order and the caps the right value and in the correct places.

Hello All,
I have decided to kit the Baby Black Widow paddle. This is the paddle that I showed a few pictures of recently. My machinist tells me he should have parts to me within 2 weeks. I have ordered a LIMITED amount. Next week, I should have a picture of the prototype for the Elecraft KX1. The paddle is the same as the PFR3 model - only the front bracket is different. I'll let everyone know when all the parts have arrived and the ordering page will be up. Thanks for your time.

Steve,

I counted the turns on all the toroids and they are right. I'm checking the signal path on transmit with a scope and I'm getting the same amount of power on the PA side of the LPF. In fact, I'm only getting the positive half of the signal, the negative half is chopped off. I'm checking the signal on the drain of Q7, Q8 and Q9. If it was the LPF causing the problem, shouldn't I be getting a higher reading on the drains? I'm just trying to figure out if I can eliminate the toroids as the source of the problem or not.

Figured it out and have 5-6 watts out on 20 and 30, and waiting for a capacitor to come to get 40 up and running. The problem was the two pole contacts weren't soldered on one of the band switches and there was a cold solder joint on one of the caps in the 30 meter portion of the LPF section. I should have it in the case and on the air in a day or two.

Topic: 816 Message: 816

Greetings Field Radio Group,

The build-it team of WD8AXB/WD8AXA & KB8CRT have placed my PFR-3 on the final path to completion.

T-2 and T-3 are being wound, then two of the big variable capacitors are installed.

Chippin' away at it a couple hours at a time have kept me fresh and focused. The 3 tests have not released any valuable smoke.

The photo of the PFR-3 perched on the rock is an inspiration.

817. CW filter and NiMh questions

Yahoo group: pfr3_group
Date: 2009-03-22 21:06:54 UTC
From: John Parnell
Topic: 817 Message: 817

Hello All! - I am eagerly (but patiently!) awaiting my kit to arrive. I have been checking mods I might want to do while building the beast... right now, all I know for sure is that

-I will add a fuse to the power

- make a pigtail with two diodes to enable the rig to run off a standard 13.8 VDC power supply.

What I *can't* find (searching this groups archives) is info on adding a CW filter. I searched the group for "filter" and did not find anything relevant. I suspect that I could use one that can be placed inline with the audio output: like this

http://www.morsex.com/misc/filter.htm

I would prefer not to "reinvent the wheel": has anybody found a nice little cw filter board that would fit inside the PFR box? OR.. am I on a Fool's Errand; that is, the unit is selective enough without messing with it? I suppose I could put one outboard in an altoids tin, but I would prefer to keep it inside...

While I am here, I would also like to ask about using 8, 1.2 NiMh batteries in the PFR: I have a bunch of these (2000 AH). Doing the math, I see that this provides 9.6 Volts - I am worried that these puppies might quickly drop below the 8 volt threshold. I note that someone posted a mod to trickle charge NiMh inside the box, I am just wondering how long theselast...?

I might try the pricey lithium disposable bats for backpacking (with a dummy bat to keep the voltage down as suggested here). For shorter trips where I can carry extra weight, I can bring a small 3 AH gel cell and my folding solar panel.

Anyway, I am glad this group is here. I have noted many good hints and suggestions that I will incorporate when I make my run at the kit. I will continue to Lurk and only show my face if I am stumped...

Hi John,

The radio is quite selective as it is made for CW in the field.
It is already in-the-box selective. You won't tune SSB with this radio.

Hi John,

This rig has great IF selectivity - a 4-pole crystal filter - which is
why I bought it. Most others only have 3 crystals in the IF filter,
and the 4-Pole is noticeably better. And it's only 300 Hz wide, so no
need for additional audio filtering.

821. Low Power

Yahoo group: pfr3_group
Date: 2009-03-23 15:01:40 UTC
From: Stewart Whitehouse
Topic: 821 Message: 821

Hi all,
Finally got to the point of testing the transmitter and am not getting full power out. Watt meter shows 2w, 3w and 4w on 40m, 30, and 20m respectively. I re-flowed the solder joints in the filter section with no change. Turns count on the toroid's are correct and playing with the spacings didn't change much. Tonight I'll see what the scope can show me. Any suggestions?

Stew,

My first transmitter test was much like yours, only my power output was lower, but the high bands had more output than the lower bands. In my case, it was a couple contacts on one of the band switches I forgot to solder. I would go over every solder connection in the transmitter section with a magnifying glass and make sure they all look good.

John

yes awaiting the start of assembly can lead to wild thoughts!

one could add a DSP filter (or a SCAF) but remember this rig was designed to be a basic rig to take anywhere (although mine is in listen mode here next to the PC at home now).

this past weekend there was a small international contest, and it was no chore separating that stations sufficiently to make some contacts, DX even, and with my low wire not my vertical!

for these bands one can do pretty well without an audio filter (which one might be more tempted to have for 80 or 160 meters not covered by this rig). if you must have an audio filter, build a NESCAF but I recommend a separate box, as you just might want to use it with other rigs. yes the case is quite full.

i have some NiMH batteries in there, but I haven't tried to drain them to see how low it will go. even at home i plug it into a medium sized gel cell, so you got the right idea to major on using the external battery, and using a set of freshly charged batteries for short periods of operating.

i recommend staying with its basic equipment for now. yes its already got enough features integrated inside. and three bands are enough diversity for a take-it-with you rig.

enjoy the build and operating it when time comes.

- I think Curt hit the nail on the head with this comment! I am grateful for those who pointed out that the rig is selective enough - I will stick with building the rig as is... my only "mod" will be a fuse on the battery pack. Now my anxiety can shift to the prospecet of winding all those torroids (dl2bqd's excellent photos here will make that much easier). Thanks again...

826. magnet wire supplied

Yahoo group: pfr3_group
Date: 2009-03-30 06:25:03 UTC
From: jtrenalone
Topic: 826 Message: 826

Hello anyone who is checking in. I am new to kit building, and have a question that may seem dumb.

I am building the PFR, and the manual indicates that the toroids are wound with either #30, #28, or #24 (T3) wire, I only seem to have supplied to magnet wire sizes. One length of larger magnet wire(green enamel), and one length of smaller dia wire (red enamal).

So, I asume that is is alright to wind toroids that call for #28 or #30 with the red wire, and the one that calls for #24 with the green wire.

Thanks in advance for any information,

Joel

Joels.

That doesn't sound right, I just received a kit last month with 3 different sizes of magnet wire. You probably need to contact Doug and let him know you only received two sizes of magnet wire. Or if you are in a hurry, you could probably buy some #28 and #30 wire, however last time I bought magne wire from Radio Shack, they only had #26.

From: nick_ulman
Topic: 829 Message: 829

See: http://www.eham.net/classifieds/detail/285136

For Sale: Fully assembled and working Hendricks PFR-3 QRP CW 40/30/20 m transceiver. See http://www.qrpkits.com/pfr3.html for specs and details about the radio. Includes internal keyer, antenna tuner, and battery holder. Does not include optional paddles. I built this radio in December 2008 and made many contacts across the USA from the west coast. It's very tough; good for portable ops or camping. Selling because I would like to buy/build more radios and XYL has a limit on number of radios in the house. $250 /obo including shipping to USA. PayPal preferred; check OK, but must wait for check to clear before shipping.

Send email to nick@... if you have questions. I don't check this group's messages very frequently. 73, Nick KZ2V

Subject: [pfr3_group] Test Equipment

Hello group!!

I would like to know from the folks who have built and use the PFR-3, what you would consider essential test equipment that is needed in order to successfully build the PFR-3. What would you consider "Must Have" test equipment vs. "It would be nice to have, but not essential".

Thank you for taking the time to read and reply.

Hi, Joseph,
A good Digital Voltmeter will perfectly do here for the kit builder
- when one knows what one will measure at certain points in the circuit.
The manual tells you.

A Dummy Load is useful to send and hear your sig in a monitor RX. So you
protect your own PFR and do not stress others.

An RF probe helps to measure and calculate power, or a Power Meter with
enclosed 50 Ohms.

A good friend who knows how to use an Oscilloscope and who can
interprete the screen - I can't.
(But since a scope also only "measures voltage", hi... use your DVM and
try to understanmd what you measure.)

Joseph

Except for a DVM nothing else is required for building this rig.

Given the investment, if you haven't built a project or two, I would suggest a simpler warm-up project. Do invest in a solder station if you dont have one -- they are much less expensive than they used to be!

Download the manual to see what you are in for!

Yes listening to its oscillators on a receiver can come in handy, but if receiver works the first time - you won't need this.

Alignment steps on the rig are simple, and supported by the microcontroller in the rig.

Hi Joseph, and all,

The list of needed test equipment is pretty much a good vom or vtvm, something with a 20,000 ohms/volt spec. and a freq readout, like another rx. Now what would also be nice would be a swr bridge with pwr measurement ability, and a generator... like a small xtal rig, say, rockmite?

It is a good rig to build, and there are many good folks here that can help out with the little problems that creep outta no where. A good soldering iron with a good technique comes in real handy too...

Kinda like riding a horse... it simply doesn't work..... until...

you get in the saddle.

Hi Stew,

I had a reversed paddle, for a bit, but a short trip around the soldering iron, and a pair of

long nose pliers... (had the wires reversed) going to the paddle. Well..... you see... I had a 50-50 chance right? *G*

About the low output, does it tune into a 50 ohm dummy load, correctly? I mean with two peaks of power? Or does it appear to reach for the peak then drop off... not tuning through the peak, just approaching it? Counting turns on toroids is a challange... I found, that I really don't like to wind toroids after midnight... soldering is ok... but not counting winding...*G*

Good luck...

Hi Guys

I am on in years, but a trick I learned from somewhere in the net is to digitally photograph a toroid with windings. Then enlarge it on my pc, then print,then count.

Counting the windings on a toroid that is A4 or letter sized is a cinch.

Have fun.

I'm using my vibroplex paddles and I know it is wired correctly.

I think you're talking about tuning through the built-in tuner. I'm
using the coax output to a dummy load through a WM2 watt meter. Getting
2 watts on 40, 3 watts on 30 and 4.5 watts on 20.

Turns count is correct but power is falling off in the lpf. Have good DC
path but not RF.

841. Magnet wire and washers revisited

Yahoo group: pfr3_group
Date: 2009-04-05 23:20:55 UTC
From: John Parnell
Topic: 841 Message: 841

I successfully did the first assembly group and passed the smoke test. I am now working on Group 2.

Erring on the side of being OCD, I am holding up work on the bottom of the board til I find out about these items:

- the correct size of magnet wire to be used on L1 and T1 (as per pg 7 of the manual). I have only two hanks of magnet wire: red and green. I suspect that the red wire I have is #30 and that the green wire I have is #24 - the missing THIRD batch of magnet wire is either #28 or #30... looking at dl3bqd's photo of t1, I see his #30 is red.. but I don't want to make any assumptions that mine is the same.

I also noted (in msgs 800, 801,804) that there is the possibility of needing to use the nylon washers for the varicaps. No one weighed in on the question of whether or not the nylon washers are for the varicaps or what their purpose is in the rig, if not the varicaps. I did a search of the pdf manual and the "Nylon" is mentioned only in the parts list (and in ref to the tuning knob spacers)...

I have a email query out to steve, if any of you have any clues/suggetions as to the above items, let me know.

btw: a bit of "humor": at my first attempt at the smoke test, nothing happened when I hooked up a 9 v bat and flicked the pwr switch: my heart sank as I pondered what to do next... then I noted that U6 was EMPTY!! I plugged in the processor and all was well... I bet I am not the only one to do this...hi hi..

I AM having fun and not in a hurry,; it will be a month or two before the mud dries on the trails here in Wa state...

Hi John,
I never got the nylon washers and several inquires to Doug haven't brought any response as to what they are for. I used the thin metal flat washers to mount the varicaps and they worked fine. I understand, from others, that the nylon washers are too thick to use for that purpose. Bill, KF8GE, and I are having fits with the Low Pass Filters and it seems the inductance values are too high. I am waiting for information on what the design values are and rewind them accordingly. For instance 15 windings on a T37-2 core (L11) should be about 1uh but I am measuring 1.6uh. Bill has reduced the number of turns on L8 and L9 and is now getting close to the correct power out on 40 meters. I wonder if some of the cores were mismarked.

Yahoo group: pfr3_group
Date: 2009-04-06 16:04:26 UTC
From: John Parnell
Topic: 841 Message: 844

Hi- I received a prompt reply from Doug on my questions:

- there ARE indeed 3 different thicknesses of magnet wire - he is sending me the missing wire (I only had the red and green)

-The 6 flat metal flat washers are to be used in the place of the nylon washers on the varicaps.

A cautionary bit of advice: I tried to pull one of the small caps out of the paper tape and managed to tear the wire off: the cap came off but the wire stayed put :) . Doug is graciously replacing one-legged cap and offers this hint: to snip the cap wires at the top of the tape - there is plenty left for fitting and soldering.

I am taking this as an indicator that it is best (for me) to do my building in 2-3 hour chunks vs a marathon session...

thanks for the replies!

Joel - maybe you have run into this as well by now: I tried winding L-1 (40 turns of #30): 40 turns of the supplied red wire does NOT fit on the red toroid. I get up to 39 turns with the inner wire jammed tight all around the inner ring of the toroid. Even if I could cram it in, it certainly would not fit another 5 turns, as specified for T1... something is amiss - I will wait to see what Doug sends...

Steve,
I never saw the kit but I assume they go between the caps 2 mounting holes
so the 2 screws that hold it in place don't bottom out inside the cap and lets
the cap turn and not have those too small screws damage the stators inside.

Subject: Re: [pfr3_group] Poly-varicap & Washers

Steve,
I never saw the kit but I assume they go between the caps 2 mounting holes so the 2 screws that hold it in place don't bottom out inside the cap and lets the cap turn and not have those too small screws damage the stators inside.

853. PFR-3 is bench-tested & ready

Yahoo group: pfr3_group
Date: 2009-04-13 04:20:25 UTC
From: Charles R. Pfister
Topic: 853 Message: 853

Hello fellow PFR-3ers!

My PFR-3 is all together and bench-tested: I bought it at Dayton FDIM in 2008.

5 watts out on all bands. It was 5 watts right off the bat.
Sensitivity is good on all bands.

When first put on the bench, it did not work.
A few mintes of checking solder connections rooted out whatever problem there was.

Folks, I followed the latest Hendricks website version of the manual.
I sent in the early IC to be reprogrammed.
I did the wire jumper mod across an IC.

I had help on the toroid-winding (for speed, and ease of my limited and interrupted assembly time).

T-3 was built "by committee" to check and double-check the windings. It was the only toroid that had to be rewound, and this was done before it was installed.

>>The transceiver works as advertised!<<

Now for the real world test with antennas. A little later this week!

73, Charlie WD8AXB
Kalamazoo County, MI
>>Thanx to WD8AXA and KB8CRT

Good Job Charlie and All!

I currently have my PFR-3 in Fairbanks, AK on a temporary job here. However, I have tried but hear little on the air and think that is because I am within a few miles of a 50,000 Watt AM transmitter tower. Noted when they are off the air, I hear signals again but not many. Past weekend, heard two Japanese and one Oregon stations on 40 M.

You discover later on that a 2 inch piece of wire goes there and is installed in the board. Its not extremely clear from the instructions, but when you're placing that huge torroid it will dawn on you that there is an unused hold on the outside of the board that the tap is supposed to go to.

860. Re: group 5 T3 main winding wire size

Yahoo group: pfr3_group
Date: 2009-04-15 14:59:01 UTC
From: David J. Wilcox, DO
Topic: 526 Message: 860

What is the real wire size needed to make the T3 torroid? I see the manual says #24, I bought Doug's kit of toroids and some extra 106-2's and the wire in the kit is #28 and #30. Deiter has worked it out to be #21 - 21.

Any suggestions? I am winding a new replacement toroid so I can just swap the new one with the correct windings and compare how it works with the original one (I bought one of the first kits at FDIM last year).

Thanks,

Dave K8WPE

861. Final Notes

Yahoo group: pfr3_group
Date: 2009-04-15 17:16:04 UTC
From: John Parnell
Topic: 861 Message: 861

Hi - Since I found others construction "de-briefs" to be of of value when I was building, I thought I would weigh in with my experience.

- I use the "revision B-2 " found in the files section of this group, not the Hendricks www page. It has the most up to date info, including the repair of the circuit board defect...

- there was some confusion with the ID of the 68 pf cap: apparently the Blue and Yellow ones marked "680" are OK to use and are interchangeable - the manual said they were marked "68"

- My kit arrived with only #24 (green) and #28 (red) magnet wire. I tried winding the "40 turn+ 5 turn" toroid and saw that it wouldn't fit. I was able to find #30 at radio shack.

- Being a former shipyard welder from the vacuum tube generation, I erred on the side of MORE heat vs cold solder joints. I used a 35 watt iron and made sure that the solder melted before lifting back the tip. I had no cold jointsn nor did I fry anything...

- The Dreaded T3: I found the drawing somewhat cryptic/confusing, but eventually figured it out it DOES contain all the info needed - the simple version: The center tap (the 2 inch piece at turn 5 1/2) goes to the hole centered on the *outer* edge of the circle - starting at the edge of the board working towards the center, the shorter the wire, the closer to the edge, the first set of holes contain the short 1 turn, the second 3 turn (?) interweaved row goes to the second and the 6 (?)turns goes to the holes furthest from the edge. Ignore the holes marked "L", they are for the BLT output. The holes will NOT neatly line up and are tricky to tighten. Tinning is important for this thick stuff... I have not tested the above with an antenna yet, if it is not right I will post a correction

- My mistakes: doing the first smoke test without plugging in the IC (!)and checking the U8 voltages on the wrong pins: the manual has a diagram showing how to count the pins (counter clockwise from the pin marked with the dot).

-Also, I did not wind the 6 "L" coils tight enough to hold my adjustments to tweak the power output; I needed to wick the solder off one side grab the nub with small needlenose, yank tight and resolder. As per suggestions: I am also going to put a dab of glue to the cores to keep them tight to the board as they bounce down the trail...

Upon my first test, using a 12.9V gel cell, I had 5 watts on 40 and 30, 2 watts on 20. After fiddling with the 20 meter coils spacing a little, it went up to 4 watss, close enough for me... it goes into the case tonight and this weekend I will try out the BLT with a lightweight doublet and wire vertical/counterpoise...

Doug promptly answered my emails, and I was always able to reach him by via phone. He was very patient and helpful. Also, thanks to those who posted advice and photos.

862. Tuner question-

Yahoo group: pfr3_group
Date: 2009-04-17 05:03:39 UTC
From: John Parnell
Topic: 862 Message: 862

I finished the kit last night round midnight and put it on 10.110 Mhz using my LDG Z100 tuner. The first station I heard was JA7EYL - I called him and he copied me 329! Not bad for midnight on 30!

This evening I tested the built-in tuner. From what I can divine from the instructions and group chatter, the proper way to connect it to my shorty g5rv was to set the rear panel toggle to balanced line, set switches to BLT and LOW Z.

I was able to tune the point where the SWR LED was dark (the tuning was SHARP)on 30 and 20. I could not tune it on 40. Just out of curiosity, I inserted an SWR meter at the output of the radio when the dark lamp indicated a match - the reading was 3:1...

Does this indicate something amiss with the tuner? Or is my knuckle-dragging, non-engineer brain missing something obvious? Also, I noted postings referring to "Steves Mods" to the BLT; I could not find any details here on this, so I assume that the Rev B2 pg 14 was the kosher way to go with BLT, T3 etc (?)...

(The reality is that, in the field, I will be using a simple vertical wire & counterpoise and/or a some kind of tv twinlead fed zepp - I don't wanna carry 2 lbs of RG8 in my backpack - I will do a dry run with these antennas in a city park this weekend and hope for the best.)

Thanks for your help...

-de k7hv/john

863. Re:Tuner question-

Yahoo group: pfr3_group
Date: 2009-04-17 09:05:52 UTC
From: rkavampsev@aol.com
Topic: 862 Message: 863

Ahhh please remember that what the L.E.D. is telling you is that there is a good match between the BLT and the output stage in the radio not the match to the antenna.
if the L.E.D. cant be dimmed then the mismatch is to great for the capabilities of the BLT to match the antenna to the output stage of the PFR3. ie 3:1 or above. In the field you will have to at least use a realitively cut length of wire to achieve a better match so the LED will dim .
I normally have with me a 120 pf variable cap with fly leads about 3 inches long and i either clip it in series with the antenna wire or accross the output and tune it. I find that this will usuall help to match the antenna and get the LED to go out .
hope that helps
Roy

864. Re: [pfr3_group] Tuner question-

Yahoo group: pfr3_group
Date: 2009-04-17 18:19:39 UTC
From: w2bpi1@aol.com
Topic: 862 Message: 864

The BLT tuner will not match everything you might want to use as a antenna. I found with mine it would load most things on 20/30, but not on 40 meters. I tried adding more capacity to the variable cap. This worked quite well on 40 but not 30/20. I was going to add a small switch to put the cap either in or out of the circuit. I no longer have the PFR3. I sold it so I could buy another kit. I added the cap to the one that is in series. (100mfd or more mica cap.) The Emtech ZM-2 and some other BLT tuners have this added feature making the tuner much more versatile. 72 Geo/W2BPI

865. Still fighting, sota long

Yahoo group: pfr3_group
Date: 2009-04-19 18:25:14 UTC
From: Stewart Whitehouse
Topic: 865 Message: 865

After countless hours of troubleshooting and running LTSpice models of the low pass filters, I'm still scratching my head. Today, after winding new L8 and L9's (again), I still only get 2 watts out on 40 meters. I'm now pretty sure the the Low Pass Filter section is not the problem. Spice models show they can be improved.

I noticed that when I touched my scope probe to TP1 the output jumped from 2 watts to 3.75 Watts!!! When I did this on 20 it blew a one amp fuse

I also notice the square wave at pin 1, 3 and 13 of U8 is not very square with rounded and distorted wave peaks but is the same shape on all bands. (Pin 3 is 6V on 20 and 5v on 40) The signal at the junction of C58 and C59 is clean on 20 meters but is dirty on 40 meters. It is almost like two signals very close in freq and the LPF takes out the stronger one, leaving me with two watts (3 watts on 30)

I would suspect the BS170's but why would they be ok on 20 meters but not on the lower bands?

Just what function does D7 (47V zener) have? Does it protect the BS170 from an over voltage situation. If so, would it be safe to lift one end to see what effect it has on signal distortion?

Any advice will be greatly appreciated. but, I don't need any more "count the turns and check the solder joints" advice.

72

866. T3 Help needed

Yahoo group: pfr3_group
Date: 2009-04-20 00:25:33 UTC
From: Steven
Topic: 866 Message: 866

My novice building skills have me sitting here dumbfounded. I feel like I have wound T3 correctly but I am baffled at the instructions. I'm stuck due to a lack of experience.

On the 8th turn I am to crip the 2" piece of #24 wire and solder to it??? Am I supposed to scrape the 8th turn???

In the instructions it says to place the windings close together but EVERY picture I have seen of them shows 3/4 of the toroid being used.

I am so close to being complete that I can smell it but I am stuck in the mud on this one.

Steve

Yes, every soldered joint on T3 has to be tinned. That 8th turn will need
to be scraped, heat stripping probably wont work.
If you look at the BLT instruction manual on Doug's site you will find some
good photographs of how it is wound.

868. Re: Tuner question-

Yahoo group: pfr3_group
Date: 2009-04-20 02:42:29 UTC
From: John Parnell
Topic: 862 Message: 868

Hi! - I had a very helpful email exchange with Steve, WB6TNL. In explaining the naure of the blt, he concluded with this suggestion for the ideal PFR antenna, worthy of sharing with the group:

"Regarding antennas: A Zepp is only a Zepp if it's a halfwave long wire end fed with a quarterwave matching section. Otherwise it's an end-fed random wire. Be that as it may, a 52-55' ft. end-fed is a good random length wire because it's not resonant at any of the three bands so the liklihood of the impedance being out of range of the BLT is reduced. I'd suggest using that and some quarterwave radials at the bands of interest. But that's me :-)."

I took his advice, went out to a park and tossed a line over a tree. I hauled up a 55 ft inverted-L wire with 3, (30/40/20) 1/4 wavelength counterpoises radiating out from the PFR. It worked like a champ. This antenna tuned EASILY on all bands and I worked stations all over the US, with much better reports than I had at home with my shorty G5RV. I have found my antenna. It was a case of "Solomon going to the Mountain": that is: it MUCH easier to make an antenna that works with the PFR as it is than it is to fiddle with the tuner, at least for me. I am now ready to hit the trail!

Thanks to all, I am good to go... 73 de k7hv/john

869. Re:T3 Help needed

Yahoo group: pfr3_group
Date: 2009-04-20 08:26:52 UTC
From: rkavampsev@aol.com
Topic: 866 Message: 869

hi steve
when winding the 16 turns
cut the lenght of wire required and fold it in half, at the fold scrape of the insulation enamel and solder a pickup loop around the folded bit as the centre connextion . then wind 8 turns either side of centre around t3 each half going the opposite way around T3 from the centre.
the ends of the windings go into the appropriate holes and the centre wire goes ito it designated hole.
hope that helps.

870. Receive Insensitivity

Yahoo group: pfr3_group
Date: 2009-04-20 15:40:44 UTC
From: miles.anderson_k2cby
Topic: 870 Message: 870

I seem to have run into a problem that -- after reading the prior posts -- nobody else has encountered: The receive sensitivity is marginal at best.

The transceiver passed all the smoke tests, and the transmitter delivers a solid 5 watts on all three bands.

The receiver "works." That is, it tunes to the right frequency, and the BFO works as it should. The problem is that I can't get a decent audio level at inputs less than 50 to 75 microvolts. When connected to an antenna the signals are few and far between, and the ambient noise on 40M is "too low." The problem is present on all bands.

I at first suspected the input tuned circuit but I have more or less eliminated that. C76 tunes the input signal on all 3 bands, and I can tweak the signal on and off peak with both trimmers.

I have also checked the parts values and solder joints.

I've got quite an assortment of test equipment.

Does anybody have measurements of the signal levels at the inputs of U4, U3a, U3b (audio), U2 and the input of the crystal filter and the output of U1 (IF)? How about the oscillator signal and BFO levels at pin 6 of U1 and U2?

Miles, K2CBY

I would go back and look at T1. Be sure it is wound exactly as per the
manual.
I had to rewind mine and it fixed the problem. Sure sounds like the same
problem
I had.

872. Re: Magnet wire and washers revisited

Yahoo group: pfr3_group
Date: 2009-04-20 22:03:21 UTC
From: lwwb100
Topic: 841 Message: 872

Doug sent me the missing parts I requested to mount the varicaps, but the replacements had the nylon washers too, which were too thick. I ended up using the thin metal washers which worked OK.

At one point I was up to 4 watts output on 40 meters, put the rig in the case and started making contacts with it. While testing it with my different portable antennas in the backyard, and watching the output on a field strength meter, all of a sudden, the output dropped off to nothing. After playing with it and not getting any output on any band, I ended up taking it out of the case and troubleshooting for several days. I finally found a stupid wiring error on my part, fixed it and was back in business, however, while I was back to 5 watts on 30 and 20 meters, I was back down to 2.5 watts on 40 meters. The next day, I replaced L8 and L9 with T37-43 toroids wound for 1.15 uH on L8 and 1.4 uH for L9. I checked the inductance with my MFJ 259B (sure wish I had an AADE capacitance /inductance meter, it's nexzt on my list of projects). After putting in the new toroids, output was still 2.5 watts. At that point I said "screw it" and mounted it back in the case. Since then, I've found I'm having problems going through the BLT and not getting normal output when going to my 40 meter vee/balanced feedline antenna. I'm going to play with that over the next few days and see what I can do about it, I sure hope I don't have to mess with T3.

Stew, since our problems on 40 meters are so similar and we received our kits the same week (same day, I think), I'm wondering if maybe some bad parts didn't work their way through the pipeline. If I ever get up the energy to pull it out of the case again, I'm thinking of replacing the BS170's and the FQPF7P06. I just don't think it's the LPF anymore, I've replaced every single component and checked every solder joint for continuiy.

Topic: 862 Message: 873

This is help-full information, thank you. I am a bit of a novice with these little radios. I have completed the PRF-3, and want to make sure that my assumption is correct.

If the radio is fed with an antenna on the BNC, and the BLT/COAX switch is switched to COAX, then according to the schematic (if I am reading correct), the tuner is completely out of the loop, and the TUNE and LOAD knobs have no effect. The only configuration that the built in tuner can be used is when you feed off of the BLACK and RED balanced line lugs. This may be obvious, but not to me at first.

I feed my base radio with a simple loop antenna, and it feeds through the window from the ladder line to a coax BNC connector. I thought that I could tune this antenna with the PFR, but I can't as long as I use the BNC in.

If anyone can confirm my logic, it would ease my piece of mind :)
Thanks,
Joel

Thanks for this info, I had tried a random wire (probably around 55-60 feet) with one end thrown up into a tree last weekend and was pretty disappointed with the results. While it was a lot easier to hook up and tune compared to my other QRP rigs, thanks to the BLT and binding posts, not only did it seem to be pretty dead on receive, but transmitting seemed even worse (an S7 QRP station I answered said he couldn't pull me out after several tries). I'm heading out to Lowe's to get some 14 AWG for radials, and here's hoping I have a lot better luck with this type of antenna tomorrow night.

It's possible to use the BLT with the BNC connector, so you can use the tuner on your loop antenna.

Put the COAX/BLT switch in the BLT position and place the toggle switch on the back so the binding posts and BNC connector are connected. The signal is now going through the BLT and is available at both the binding posts or the BNC connector.

Hi Jon,

If you look at the trimmers, you will see what appears to be a full or nearly full circle of brass. When the trimmers are fully meshed, the rotor (part the turns) will be meshed, (like fingers together when your hands are folded) and form what looks like a half circle of brass. This condition allows the trimmers to provide the most capacity.

888. New Product Announcement - PFR-3 Portable Paddle

Yahoo group: pfr3_group
Date: 2009-04-30 02:25:50 UTC
From: w5jhjerry
Topic: 888 Message: 888

All,

This is a new product announcement for a light weight, high quality, portable paddle. This paddle was designed to fit the Hendricks PFR-3 transceiver. However, it can also be used as a portable paddle for any radio. I have also designed a paddle to fit the Elecraft KX1. However, I am about 2 weeks from announcing that product. What makes this paddle special? First it is a small size but not too small! The base measures 2 inch x 3 inch. The base is black anodized aluminum. The front bracket (which fits the PFR-3) is also anodized aluminum. This keeps the weight down to 7.5 ounces for the entire paddle. The paddle arms, contact posts, tension bar, and posts are made of brass. All parts are machined on CNC milling machines. The heavier brass arms help prevent contact bounce. Most keyers are very forgiving of contact bounce but some of the high speed keyers are not forgiving at all. The arms ride on ball bearings just like the Black Widow paddle for a very smooth feel. In fact, this paddle shares many of the design concepts of the Black Widow. Because of the similarities, the new paddle has been named the Baby Black Widow. The contacts are the same silver plated screws as is used by the Black Widow.
Like its big brother, this paddle comes as a kit. However, since the base and bracket are anodized, there is less finishing to be done. I have tryed to hold costs down so that almost everyone can own one of these paddles. This paddle sells for $46.50 shipped in the USA with payment via paypal. I ship via 1st Class Mail. More information and ordering can be seen at:

http://www.w5jh.net/bbw_pfr3.htm

I thank you for your support.

73, Jerry W5JH

889. Finished PFR3, some questions about the BLT

Yahoo group: pfr3_group
Date: 2009-05-01 05:23:10 UTC
From: Jon - N7WNX
Topic: 889 Message: 889

I just finished my PFR3 and brought the output to 5w on
all bands by messing with L8,10,12.

I tried the BLT today with my Norcal doublet. I can
totally darken the LED on 20m. I can dim it on
40 and 30 but not make it go away.

When I switch to coax mode and go through an external tuner,
the LED still functions when I'm in "tune" mode.
It seems that, in this configuration, I have a pretty good,
but not perfect SWR when the LED is dimmed 1/2 way but not off.

Do you think that means that I have an OK swr on 40 and 30
when I'm using the BLT and the LED dims 1/2 way?

It sure seems like that might be the case.

Let me know what you think?

Thanks,

Jon

The antenna is nothing fancy. It is a Hustler 5BTV with a 30 meter trap and 17 add on from DXengineering. It is ground mounted with 16 radials. A decent antenna, patience and perseverance is the trick. I setup a separate logging program just for QRP. Allowed me to check the DX spots against what I need for QRP.

Thanks Roy,

Actually, it looks like on 40m, my "tune" varicon wants to
go a little bit lower (counterclockwise), on 30m,
my "load" varicon wants to go a little bit lower.
On 20m, my load varicon is maxed out (clockwise) but gets the LED
dimmer than any of the other settings. Sounds like
maybe a cap across the load varicon might help with
20m but might screw up 30m further.

Which of the pins on the varicon do you solder the
cap across? The outside ones or one outside one to the
center?

Also, given this situation, does anyone have any suggestions
about compressing or widening the turns on T3?

Thanks,

Jon

Hi again Jon
if needed you solder from the centre pin to either of the outside pins depending on which section of the varican required padding .
If you are tryng to get less capacity in the varicon then im afraid that its a matter of opening out the turns on T1 or 2. Ive not tried this but you try fitting a brass slug inside T1 or 2 and see if that reduces the inductance, just a thought.
cheers

I'm a bozo (but you probably already figured that out).
I had the coax/blt switch on blt and the antenna switch
on coax.

Anyway, after widening the turns on T3 and tweeking
the trims on the "tune" varicap, I am now able to
tune 30m and 40m perfectly (with my Norcal 44ft doublet).

When tuning 20m, the "tune" varicap is all the way up
and the "load" varicap is all the way down but this
dims the LED halfway which according to my QRP
wattmeter when doing it the other way via coax and an external
tuner, is still a decent SWR.

Sounds like this is about as good a result as anyone
is getting.

Great rx. The filter is the perfect width. I don't seem to
tune by anyone by mistake but still can deal with stations
pretty close together.

Thanks for all advise and help,

Jon

When you say "widening", you mean merely separating the wire turns on T3 more with a screwdriver or some-such? If so, I will certainly try it!

Hi John,

Yes, this seemed to help. I also do not believe now that
the LED has to go that dark to have an acceptable SWR.
When I use the coax settings and an external tuner but
switch to the tune mode, I can dim the LED halfway and have
an SWR of 1.5:1. I hope this translates to the BLT side of
things but there is no way of knowing.

From: wb8yyy_curt
Topic: 880 Message: 901

Pete

it is not a silly question. if you research this particular vfo part, you can find its minimum step size. however, note something has to create a digital word to command the DDS -- and that would be the limit in the PFR3.

i have not studied the pfr3 dds in detail, but if you sniff it with an external counter you can see what is going on. you may find for example that the step size may be a little smaller than the display.

and also note the RIT mode gives extra resolution! so unless you want to zero beat to extreme percision -- you may find RIT tuning sufficient.

if you want to experiment more with DDS's -- i suspect a few QRP clubs etc may still offer a circuit board that can be controlled from a pc.

Topic: 520 Message: 903

Hmmmmm as they say. This is one problem ive found with the PFR3 I Ibuilt mine and fitted the supplied battery pack used it with duracell batteries and they lasted about 4-5 hours use. Then got the screw driver out to replace them but in the meantime in Lidl super market found some NIMH battery at 2.5 amp AA size very cheap. However you need 10 to make up 12 volts so bought a double aa holder and stuck it on the outside with double sided tape and drilled a hole in the end plate which is part of the bottom and therefore comes away with the battery pack on unscrewing the bottom plate wired an 2.5mm jack from the battery pack so it plugs into the normal external supply socket and i havent had to change batteries now for over a year . Just unplug the lead from the battery pack, plug it into the charger and away we go . no batteries to buy and no unscrewing of the battery chassis.
I have fitted an external inline fuse with the battery fly lead just in case. (750milliamp)
So i would recommend doing this small mod instead of buying dry batteries all the time .
You can always fitt dry celll into the inside if you want and just short out the external battery container with a fly lead if nccessary should you not be able to charge the normal pack.
Now whilst im on i have been doing some checks of the tracking of the receiver front end and with the coils as described it is not that good .
I have removed the varicap and fitted trimmers which are switched into circiut with a three way switch in the hole for the varicon and trimmed each band to the main qrp frequency .
As doug says i can now get a good 0.2 uv sensitivity within +/- about 20 kcs of tuning which is all i want
cheers all and 73's

Topic: 908 Message: 908

Hi folks,

just finished building my new "yellow fellow" PFR-3! The kit was almost complete, 2 resistors 330k and the swr indicator LED were missing but easily found in the junk box. In opposite, all 3 sizes of magnet wire were supplied. Wow!

Building and calibrating the kit went fine without problems, the pics of the toroids in the photo section helped a lot. With the low pass filter L´s wound quite tight and evenly spaced I instantly got between 5 and 5.4 watts out, so no further adjustment required.

I did the audio mod with a 2.2 µF tantalum cap between pins 1 and 8 of the audio amp, and damped down the side tone with a 150 pF capacitor between the C27/R14 junction and ground. With a cap, the side tone sound is not so harsh anymore.

As well, I included a battery monitor with a LED and a test pushbutton on the rear side: A transistor turns the LED on when the supply voltage (decreased by 2 zener diodes of 5.1 volts each) is still above 0.7 volts. The parts are wired "manhattan style".

Best 73 and thanks to the group de Christian DL1ELU

917. For Sale: Un-built PFR-3 Transceiver Kit, Digital Dial Kit, Toroid Kit, Polyvaricon Caps

Yahoo group: pfr3_group
Date: 2009-05-19 23:01:02 UTC
From: Jeff T. Casey
Topic: 917 Message: 917

Hi gang,

I have for sale a not-yet-built PFR-3 transceiver kit that I won’t have the time to build/operate anytime soon. All parts are still sealed in the packages, just as they came from Doug Hendricks. The price is $140 including shipping within the continental U.S.

I also have for sale three additional Hendricks kits:
- a Digital Dial kit for $20
- a Toroid kit for $25
- a Polyvaricon Cap kit for $8

The price for the entire package, including the PFR-3 transceiver, Digital Dial, Toroids, and Polyvaricon Caps, is $175.

All prices include shipping within the continental U.S.

Payment by USPS money order only.

Thanks very much, 73 & 72,
Jeff

Hi gang,

I have for sale a not-yet-built PFR-3 transceiver kit that I won't have the time to build/operate anytime soon. All parts are still sealed in the packages, just as they came from Doug Hendricks. The price is $140 including shipping within the continental U.S.

I also have for sale three additional Hendricks kits:
- a Digital Dial kit for $20
- a Toroid kit for $25
- a Polyvaricon Cap kit for $8

The price for the entire package, including the PFR-3 transceiver, Digital Dial, Toroids, and Polyvaricon Caps, is $175.

All prices include shipping within the continental U.S.

Payment by USPS money order only.

Thanks very much, 73 & 72,
Jeff

From: Ken Evans
Topic: 926 Message: 927

Gary,

You have all the info you need. Go to Frys as they will probably have it. Just tell them 680 pf mono capacitor. If there is a voltage rating it would be at most 50 volts.

If you cannot find one, you could still test the PFR out on 30 or 20 meters as C61 appears to be in the 40 M bpf.

Ken

929. PFR3 for sale

Yahoo group: pfr3_group
Date: 2009-06-02 18:38:17 UTC
From: boblusby
Topic: 929 Message: 929

For sale: PFR3 and paddle recently completed with low mileage (no QSOs). The internal battery case has not been installed in order for the new owner to incorporate one of the battery mods as part of the install. Likewise the paddle has not been built. Asking $235 shipped in the lower 48. This is the second PFR3 I have built and this one is all checked out and ready to go on the air. Reply off-list to k9foh@.... I can't get the picture attachment feature to work but will email pictures on request. Cheers, Bob.

933. Almost there

Yahoo group: pfr3_group
Date: 2009-06-04 20:38:56 UTC
From: Gary W. Marklund
Topic: 933 Message: 933

I'm getting a flat 5 watts on 40M, 4.75 watts on 30M and about 2 watts on 20M. I've confirmed the turns count and moved the windings about, but can't get better than 2 or 2.5 watts on 20M. Also, the external power connector is a bit oversized for the hole in the back of the chassis. What have others done? Look for another connector, use a step drill to enlarge the existing hole or try to tap the hole to allow the connector to be threaded in?

Thanks and 73,

Gary KJ7RT

934. PFR-3 and NorCal Doublet

Yahoo group: pfr3_group
Date: 2009-06-06 15:01:46 UTC
From: Michael
Topic: 934 Message: 934

Modifications to my NorCal doublet antenna.
After last years SOTA activations with the PFR-3 and norcal doublet I decided to try a few "improvements".
One aspect of the computer ribbon cable doublet that gave cause for concern was its apparent fragility, during the last portable season one of the 22' legs managed to stretch by 6 inches.
I seem to remember getting it snagged on a rock while on SOTA GM/SI-209 .
The other problem I encountered was the excess of feeder when using the standard 7-meter fishing pole as a support, but this rather depends on the type/height of pole and distance from the mast to the operating position.
As I tend to operate quite close to the base of the mast 17 feet of feeder seemed to be about the optimum length needed. Starting out with 50 feet of speaker wire or zip cord and by using 17 feet of this as the feeder the remaining 33 feet was separated to form both legs of the dipole.
This arrangement seems to work very well with the PFR-3, the atu tuning all bands very easily. A test in the garden resulted in QSO's with LA1ENA/P on 7MHz, DL/LX1NO/P on 10Mhz, and 9A/OE3WGC on 14MHz.
Now to get out and try it on a hill ..

936. PFR-3 For Sale.

Yahoo group: pfr3_group
Date: 2009-06-10 01:46:50 UTC
From: k7ddmjb
Topic: 936 Message: 936

I have a PFR3 which is assembled and has been to KD1JV for tweeking.
The basic radio works as published but I haven't been able to get the tuner section to work correctly. I have no idea what I haven't done correctly but it simply won't tune anything.
I don't have time to mess with it at the moment and quite frankly, I can't seem to get use to using something without a KNOB so, I am going to make room for something new and want to clear out a few of the items I am not currently using.
Bonus, it comes with the optional key and has the internal battery cases included.
Looks great and works as described.
I'll take PayPal if you want, or US Postal Money Order via Mail.
First come, first served and $210 and its yours. Shipping is included to the lower 48.
I would prefer not to deal with the whole customs issue but if you are from outside the USA and are the first one I confirm then we can talk about the shipping and paperwork..
Local buyers can pick it up in Peoria, AZ.

OK, now is your chance.

Thanks...

940. PFR-3 Switches

Yahoo group: pfr3_group
Date: 2009-06-16 20:20:54 UTC
From: lwwb100
Topic: 940 Message: 940

Has anyone else had any problems with the switches in their PFR-3's? Shortly after finishing mine, the rig would refuse to switch to 40 meters sometimes and would stay on 30 when the switch was in the 40 meter position. At least once, while it was on 40 meters, it switched to 30 meters by itself. I thought it may have been an intermittent short on one of the resistors coming off the processor which controls band selection. Now, the power switch refuses to slide all the way into the off position and I have to switch it to External to get it to turn off. I'm thinking both the switches are bad and am going to replace all of them. Just wondering if anyone else has had the same problem?

Topic: 940 Message: 943

I havn't had that problem with the switches on the PFR3, however there are switches very similar that I have experienced similar situations with, traceable to too much heat applied for too long during a soldering process. I'm not sayin that that is specifically the case, however, if that is a possiblity, it might be worth checking out. with either clip leads across the switch contacts, or with another means.

Bill the power switch not switching off was a problem i had, but found that
it was the paddle screw that was going to far into the set and stopping
the power switch from moving fully over .
I filed about an 1/8 inch of the screww and all was then ok .
Ive had no problems touch wood with the other switches as yet .
cheers roy

From: poeli111
Topic: 946 Message: 946

Hi folks,

since day one with my yellow fellow I struggeled with the original paddles, the touch was too soft and wobbly and it gave too little feedback when operating. Sometimes I even managed to stick together the paddles when squeezing too hard...

Now the day has come to do some improvement: I disassembled the whole thing and cut the flexing metal stripes about 18 mm (3/4"). I turned the center contact screw fully in and left away the nut as the screw was self locking at the end of the thread. Now the silicon fingerpieces sit next to the center screw. I melted holes into the inner side of the fingerpieces using a small soldering iron (not very professional and stinks, I know...) Having reassembled the paddles, I now have a defined turn-on point and much less travel. Keying is more fun now.

I made a photo of the shortened paddles, see the photo section.

949. Another Scottish PFR-3 and BBW!

Yahoo group: pfr3_group
Date: 2009-06-18 11:44:08 UTC
From: jim_moar
Topic: 949 Message: 949

I'm glad to say that my PFR-3 and BBW are both assembled and working. 6W at 12V supply across all bands. I intend to use a LM2941T variable low drop-out regulator to give some control over the external supply voltage and output power. I'll probably incorporate it into the power lead.

Info for other potential UK buyers - PFR-3 delivery in 1 month, VAT £12.43, BBW delivery 19 days, VAT £4.10. Both had the Royal Mail £8.00 handling charge added on top of the VAT!

And a general question - the photo of T3 on the manual version B.2 shows one of the output wires passing through the T3 core centre. I built my one this way and it works, but does this not effectively add (or subtract) a turn on T3 secondary?

Both are nice kits, now to try to get my CW up to speed!

Jim

Hi Jim
Glad you like your yellow box and BBW.

I made a video last nite's milliwatt sprint where you can see the BBW:
http://www.youtube.com/watch?v=6mIDqOJW3Rs

Hope to QSO Jim. My experience up to date show the best chances for DX from here to Europe is on 30m. I didnt have much luck on 20 and 40 gives strong reports all almost all over North America.

I became unhappy with my PFR-3 and put it up for sale.
The fellow who purchased it said it now didn't have proper output on 40 meters and I agreed to have him return it to me and we basiclly reversed the deal.
Sure enough, I had a problem. I decided to just sit down and figure out what was wrong and what I didn't like about the rig and see if I could solve my problems. I found a cold solder joint at one of the 40 meter band pass inductors so I reflowed it and then decided perhaps it might not be a bad idea to just use my hobby store embossing hot air tool to just reflow all of the joints on the bottom of the board, so I did. I then went about doing a bit of replacement of some of the wiring I had put in and generally clean up the rig.
I have been rewarded for my efforts. The rig works better than it ever has since I built it. More audio, the TUNER NOW WORKS, (RTFM helps, DUHHH!) and I have max power on all bands! WOO HOO!
Lets celebrate and put the thing on the air! 6BTV on the ground for antenna and a gel cell for power.

First qso, KØDTJ in Longmont Co, 569 40 meters. 0220 hrs.GMT
Second QSO, ZL2MYT on 20 meters, 559. 0248 hrs GMT
Third QSO, SM3EVR on 30 meters.559. 0300 Hrs.GMT
Forth Qso, VA7QB on 20 meters. 559. 0440 Hrs. GMT

Now that isn't bad for a trap vertical on the ground with only 2 chicken wire radials and 5 watts from a kit radio powered by a gel cell!

I now have my new Baby Black Widow Paddle properly adjusted and the spring stretched out a bit and we be on da air in style man! Thank you Jerry Haigwood.

I already thanked my would be buyer for getting me off my butt and fixing the issues I had with the rig and bringing it up to its full potential. Now I think the little yellow rig has a new found place of respect in my QRP arsenal of radio toys.

Now, when is that next QRP event outside? Field Day??

954. Weber Dual bander

Although it is not a PFR-3 I would like to comment on the new Weber Dual Band CW Transceiver that I purchased at Dayton this year. This is one of the best buys I have made in the last several years. Over the last several years I have built most of tht Elecraft line, two PFR-3's, the Wilderness Radio Sierra, LDG tuners, Tuna Tins, a Genesis G-40, and a few others I don't recall. But the little 'Red-top' Weber Dual Bander has to be one of the easiest and smoothest builds to date.
One tip I would offer for builders is to be sure to install the tilt stand prior to final installation. Otherwise you'll do what I had to do and unsolder the coax connector and remove the board. A step needs to be added to the construction as I just breezed right on through and was so pleased to get full power output that I missed the tilt stand. Working with #30 wire for the T-1 & T-2 coils was the hardest step. I recommend the lighter/sandpaper method of stripping the enamel.
I also added an on/off switch on the rear panel and a slightly larger tuning knob. Operation is straight forward. I plan on using this on 40/15 for Field Day with the Wilderness Radio Sierra on the other bands.

Cheers, Bob, k9foh

Christian,
Thanks for sharing the paddle modifications, set about my key last night with the tin snips, Completed the mod as you described but used a craft knife to cut the apertures in the finger pieces!!!.
After trying the modified key on the air today, it was well worth the effort.
The soft soggy feel is gone, its now positive and responsive with the added bonus that the slightly shorter paddles = more room in the travel case.

Well I decided to post a few pictures and put in a few comments about my newly reserected PFR3.
I have installed a set of LiPo4 batteries (the blue ones in the picture) with double stick tape and used PowerPoles to make then removeable and thus rechargable when outside the radio.
As you can see, the Baby Black Widow has taken it's rightful place and is my dedicated paddle for that rig.
I am so happy that it is working full tilt boogie and the tuner is working that I decided to take a few measurement and use an external power meter to aid in the tune up and see what it was doing. WOW! nearly 6 watts on all bands if you use the BLT and tweek it in carefully! I double checked the WM-2 against my SX-1000 meter and it shows 7 watts output! Guess I'll have to keep an eye on the power to keep it "Legal" for QRP qualifying events!
I found a fellow in China on E-Bay that offered these in the ear bud earphones designed for the I-Pod and MP3 players and the sensitivity on these was VERY good at 108Db and they were only about $7 with Free shipping so I tried them out and liked them so well I bought a couple of additional pairs for spares. It really makes the audio LOUD in this rig now. No mods needed.
I'll post more as interest and activity permit.
Gotta get ready for Field Day next weekend!

Best 72, 73

Great Field Day 2009. See photos. Used an EFHWA and Counterpoise (63ft. / 35ft. in inverted L confirguration. I took a major break (8 hours) to sleep through thunder storms and more than an inch of rain. Highligts were working Steve (WG0AT), Peanuts, Rooster & Dave on 20 before the official start. Worked W1AW too. Didn't hear many of my friends. FD is a lot like Church on Easter Sunday. The turn out is awesome but it's hard to find your friends among all the strangers! The PFR-3 worked like a champ & thanks to Dale Putnam (WC7R) for finishing the build I started in time for FD!

967. Group 2 test fails

Yahoo group: pfr3_group
Date: 2009-06-30 03:59:39 UTC
From: don_k7og
Topic: 967 Message: 967

OK. I triple checked the parts placement and retouched all the solder joints and Group 1 test works fine.

When I power up, I hear hiss that adjusts with the volume and the side tone when I hit the keyer. Voltages are about right for U1, U2, U3, and U4.

In CAL.r mode, I can't get any signal on my scope at the test point TP1. I have no frequency counter but I should at least see something.

In CAL.o mode, I don't see audio product detector beat note on pin 7 with my scope. Just junk, I guess unless it's higher frequency than my scope can detect.

I cannot hear the BFO beat note, just the really loud side tone.

Where do I look? I touched up the crystal solder joints three times. I'm at my wits end. I managed to build an MMR-40 that works and other kits so this should work FB.

How much is it the PFR3?
The site doesn't mention the price.
Thanks in advance.

Francesco,

Hendricks QRP Kits has temporarily removed price information so people won't try to place orders while they're closed during June and July.

When I ordered mine last year, it was $200 plus $40 for the optional paddle. Not sure if that price changed in the interim, but I don't think so.

Don,

It sounds like the DDS is not generating a signal. I could be it is not getting data from the processor, are one or more missing solder connections to some of the SMT parts, or the DDS somehow got toasted.

Look carefully at all the SMT parts to make sure they got soldered on both ends and there are no solder shorts between pins on the DDS chip. (except for the two in the lower right corner, which are connected together and may look like a short)

You might have to send the board to me to replace the chip.

Just the clue I was looking for when you said 'data.' I re-flowed the processor chip socket - no go - but then when I pulled the processor out and reseated it, I got a pulse. Must have a marginal connection to a pin or two.

981. Noisy Audio with Ext Spkr Amp

Yahoo group: pfr3_group
Date: 2009-07-03 21:23:04 UTC
From: jim.ford15
Topic: 981 Message: 981

I often use an external Radio Shack (LM386) speaker amp instead of using headphones but get a pronounced objectionable hiss in the audio. I think this is due to a noisy LM385 in the PFR or possibly the LM386 in either the PFR or external Radio Shack amp. On headphones the noise is not as bad but still noisier than I think it should be. I tried to look up the LM385 noise specs but I could not find them. Does anybody have any lower noise amp suggestions?

Thanks,

Jim Ford, N6JF

982. Re: [pfr3_group] Noisy Audio with Ext Spkr Amp

From: sigcom@juno.com
Topic: 981 Message: 982

Jim,

The RS amp. is a great little unit (I use mine for all sorts of testing) but has -way- too much gain when using it with the PFR. On a trip to the mountains with Mike WA6MER, we did manage to get it below the threshold of pain by finnagling the two volume controls but you're right, there's just too much noise floor in the RS amp. (My opinion is that this is -not- an issue with the 386 in the PFR, per se and the 358 is -not- contributing to the issue).

A more effective solution would be removing the gain boost capacitor from between pins 1 and 8 of the 386 in the RS amp.. That should do the trick for you. If you use the amp. for other testing and need the extra gain, you could install a toggle switch to switch the capacitor in and out.

-OR-

If you don't mind making a simple mod. to the PRF, simply hang a capacitor across pins 1 and 8 of the PFR's 386. I don't recommend the maximum value (10 uF), something smaller will probably be better (see the National Semi datasheet for the details).

Disclaimer: I have not tried this but I don't see why it won't work. It -will- add some noise but not anything like trying to use an unmodified RS amp.. and the PFR's current on receive will be somewhat higher.

Best of luck with the project.

983. External battery for PFR3

Yahoo group: pfr3_group
Date: 2009-07-11 17:19:10 UTC
From: Bob
Topic: 983 Message: 983

I recently found what appears to be an excellent battery for the PFR3, KX1, K1 or other QRP rig in the field:

It's a very compact lithium battery pack rated at 12V 3.5Ah - just a little smaller than the KX1 footprint.

I have not used it over many re-charge cycles yet, or measured its performance but it does give several hours' operation with the KX1 and is a great deal lighter and easier to carry than an SLA type. The charger that comes with it looks cheap but works. The battery itself is encased in a metal box with on/off switch. I don't notice any heat when it's being charged.

I have no commercial ties with the guy selling these on eBay and I take no responsibility if you buy one and have any problems. Mine works just fine and I thought it may be of interest to other QRP enthusiasts.

Details are here: http://www.tinyurl.com/QRPbattery

Thought I would update this. After final assembly the problem with the ATMEGA chip popped up again. If I pushed down on the chip, the BFO would oscillate. I reflowed the socket once again for the fourth or fifth time but still the same problem. I finally spent some quality time with unsolder braid and removed the socket. I don't have any evidence but I suspect the socket was damaged some how. I cannot imagine the PIC chip would respond to pressing down on it. I have a ZIF socket on order from Jameco and hope to put this rig on the air soon. A good mod, if you are just building, would be to buy a 28 pin socket with machine pins for a little insurance.

Just because pushing on the processor chip fixes the problem, doesn't always mean the problem is there! The stress on put on the board when pushing on the processor chip goes all over the board.

When tracking down intermitents, I often find the problem far removed from the area of the board which seems most sensitive to the "tap test".

I would take a close look at the SMT parts around the DDS chip and make sure they are soldered on both ends. Also look around U2 and the BFO crystal. The problem is likely in one of these areas.

Topic: 967 Message: 989

Although unlikely it's possible there is a small fracture in the chip in a region that can cause an intermittent connection and yet still not go psychotic or completely cactus fucktus..

I have spent MANY hours tracking down intermittent problems - once at sea on a research vessel in which we had intermittent problems with a device made up of DIP strips and discrete (TTL - a hell of a long time ago) chips. We never found the problem until after a year of intermittent behavior when we disassembled the device and found a hair-line fracture - with exposure to sea air and dirt you can imagine the picture...

please update the list when you get the new socket - nothing will beat a ZIF - will it fit on the board?

Grant / KT6L

993. FOBB 2009 and memory keyer

Yahoo group: pfr3_group
Date: 2009-07-27 02:55:02 UTC
From: w0ese
Topic: 993 Message: 993

Used the yellow radio this year in FOBB. The yellow reminds me more of "civil defense Yellow" than bumble bees so it sports a "CD" logo (center of front panel). Kindda looks like a mini Gonset "Gooney bird". The little radio did great matched up with a W3EDP set up like an inverted L up about 25 feet.

Wish the memory keyer worked better. It seems to enjoy botching my call sign about every 4th time. This issue has happened since it was born but usually does not bother me. It would have been nice to use it to call CQ for the contest but I just don't have enough confidence it using it.

Steve

definitely check out your pfr-3 tuning antennas you are familiar with. for a 40-20 m rig, i would consider these options:

a) end fed wire around 60 feet -- attach a counterpoise of say 15-20 feet on the other terminal. rationale - 66 feet is a half wave on 40. i used this a couple times with my rig when it was convenient to not have a t-line

b) try a center fed with twin lead at least 22 feet on each leg - i would not go any shorter than that.

i would travel with a and b both, and use what fits the situation.

also if your rig is an early one, make sure you are using the revised instructions for the BLT transformer. with the original design it would not match well on 20m.

the rig is nice but not quite plug-and-play -- of course this is supposed to be an experimental hobby!

Hi Steve,

It sounds like you're describing a 44-foot doublet. Each arm is 22 feet long, and it's fed with 300 or 450 ohm line. Why 44 feet? LB Cebik (SK) has an article that shows that this antenna will radiate broadside to the wire (just like a regular half-wave dipole) on 40 - 10meters. I like that because then I know what direction my power is going. It requires a balanced line tuner, and I use a BLT available in kit form from Hendricks QRP Kits. I use mine in an inverted vee configuration, since that only requires one "skyhook". Since you're using a PFR-3, you can cover 40, 30, and 20m with this single antenna - another nice feature.

The thing I like about this antenna compared to an end-fed wire is that - for a given height above ground (30 feet is convenient), the results are predictable.

I used the 44-foot dipole as an inverted vee in the Flight of the Bumblebees contest this weekend running 2 watts from my Wilderness Sierra, and I like it.

I intend to make a center fed antenna with twin lead as a feeder, for use with my PFR-3. Has anyone found the optimal length of wire and feedline?

So far it has been hit and miss with the antennas that I have been using. The BLT is very moody in my opinion. I know that the construction of my BLT is solid and correct according to the directions. Any thoughts would be greatly appreciated.

I concure that a "44" is the best CF antenna to use, as it will work on all three bands. I have tested this antenna with the PFR-3 and was able to match on all three bands with no problem. Just make sure the feed line length is not close to odd multiples of 1/4 wave on any of the bands.

Guys,

I have one of the first PR-3s right from the hands of Doug himself at Dayton in 2008. It has the original BLT coil (un-modified).

Last night I had a few minutes and cut 50 feet of four conductor computer wire into a NorCal Doublet. I strung it up in the center on a Black Widow 20 foot fishing pole on the lawn at my cottage. It tuned beautifully on all three bands. I have other antennas I use with this rig but for simplicity and low cost this antenna can't be beat. Try it. You'll like it!

What are my ideal feedline lengths for the 44' (total) dipole? I read on the NORCAL web page that 28' is a good start. What are lengths to avoid?

I just ordered a "dublet" from e-Bay and sold by a ham. His is 46' (total dipole). Sold as "QRP HF Portable Backback Doublet Antenna 10-40 meters". In his letter of thanks to the seller, he said he has sold many of these and had no complaints. $15 plus shipping.

Hey Gang,

Well plans have changed twice but the final/final plan is to pick up
the XYL after work at 13:30 hrs and head North.
That should put us at Flagstaff in time for a brief check in and
drop the bags, find out where everyone is going for dinner and still get
there on time!
I'll be taking the IC-703+ in the truck along with a Hamstick for
20M and a 6 meter antenna.
The PFR3,Baby Black Widow and PAR Dual bander 40/20 will tag along
as well as my portable vertical. Just in case I get the chance to get on the
air.
Saturday at the forums and the pot luck dinner and then Sunday down
the road to Seligman to visit Mom. Home on Sunday evening.
Should be a full weekend. I only wish I could have gone up earlier but I'll
takes what I can gets. ;>)

I'll be listening on the way up between 14.06 and 50.125.

If you'd like to ship or have the kit shipped to me, I will be happy to build it for you, tune it, document the specs and keep you informed as to the progress along the way. There are a couple questions that I would be asking, one about the paddles, and second about the batteries. And the charges usually run about 10 or 12 dollars for the shipping each way. But we figure that out afterwards.

I've been building for many years, and am in commercial communications, and have been for the same years. I'd be happy to help you get a PFR3 on the air.

Actually, there is someone that builds PFR3 rigs. Optimizes and documents the specs, and when done ships them to the owner, well packed. He is happy to help those that can't build for whatever reason. The cost is the actual cost of shipping, to and from.

No he hasn't advertised, and he isn't flash fast either.. just very good at what he does, and that is to provide the step that some have difficulty with.

Hi Dennis and all,

The optimized docs are individualized, as these are kits, and are not a production run, each radio may and do contain specifications that are individual to that particular radio. The specs could be averaged, and be presented as a not to exceed figure, however, that leads to other than specifics. And one should also take into consideration that each kit is not serial numbered.

for example:

PRF-3
Built for WD9F
By WC7S
Quality Electronics
5503 N. College Dr.
Cheyenne, Wy. 82009
12 June 2009
Specifications as measured
Tx into 50 ohm load
using General Dynamics R2600 System Analyzer
On indicated freq +/- >10 cycles.
Band Rx mds Tx pwr I(tx)-9.6/12/0vdc
40 .12uv/-125.4dbm 3.09/4.9 410/600ma
30 .11uv/--125.9dbm 3.63/5.75 600/700
20 .1uv/-126.4dbm 3.63/5.49 610/790
Nominal voltage 9.6/12.0
Your individual kit may, more than likely will be very similar.

1018. Antenna Tuner "reflections"

Yahoo group: pfr3_group
Date: 2009-08-26 18:03:46 UTC
From: orangelite
Topic: 1018 Message: 1018

Hi - I am just back from my first "field" use of the PFR: I was in N. California camping with my bro on the Trinity river, near Willow Creek off Hwy 299. I used a 3.5 Ah gel cell and a 48 ft longwire antenna with 1/4 wave ground counterpoises for each band.

My experience using the radio from the camp made me feel MUCH better about the built-in BLT: I was initially concerned that the tuner light did not dim all the way on 30 and 40. This fear was erased when I was able to work east coast stations on both bands. On 40, the light BARELY dimmed and I got out just fine. Upon return and fiddling around with the rig with a swr meter, I note that when the light barely dims, it is about a 2:1 match... not bad.

I have seen this mentioned before here, but felt I should chime in again; it might save some of you from fiddling with the beastly BLT torroid... it works better than you might think! In MY experience, if the tune LED dims even a little, it will work stations...

I will be QRV with the PFR from WA coast backpacking campsites Sept 2 - 6. Vertical wire next to salt water... Yee-haw...

1020. LPF adjustment...

Yahoo group: pfr3_group
Date: 2009-08-28 20:01:56 UTC
From: iapizloj
Topic: 1020 Message: 1020

Folks,
I have enjoyed the last two days of my holidays building a PFR3.
Other than a little detective work and a big loupe to trace down two or three SMD parts "half soldered", the rest is history.
Following some advices on the group I have used the BLT manual to get some hints for the preparation of the big toroid, and the advice from W4DU's review on "tagging" the wires.
Reception is OK, and power too, over 5 watts. I wonder how important is to tweek the LPF coils to reduce the power to 5 watts.
Any hints?

that is very cool Woody... very cool!!

It is a good radio. But better when you tell the guys responsible for it too.

Subject: [pfr3_group] PFR-3 my best portable rig!

After almost two months of heavy use I'm ready to declare the PFR-3 my best portable rig. I'm comparing it to a shelf full of kit & commercial QRP rigs. Having the self contained batteries, the built in tuner, the versatility of antenna selection & power sources plus the great receiver packaged in the sturdy PFR-3 package, nothing I already have comes close to beating it....and I've even learned to like the color. Thanks to Steve and Doug for this awesome little gift! / Woody / WD9F

I agree Woody, except for the comment about the color. That's the best part of the PFR3. You can flash it at the stream you are fishing to attract the fish or in an emergency use it to catch the attention of the rescue helicopter. I may even solder all the parts together someday and put them into the case!

1025. PFR in the Field

Yahoo group: pfr3_group
Date: 2009-09-08 06:49:12 UTC
From: orangelite
Topic: 1025 Message: 1025

I finally took the PFR into the "field". I spent 4 days camping in on a wilderness beach on Wa state's Olympic Penninsula. I was impressed by the durability of the unit: I dropped it TWICE, once on a log another face down on to wet sand. It didn't miss a beat. I also realize why they wanted it yellow: it makes it hard to lose or step on. Using a 55 ft end fed longwire angled up to 35 ft (and 1/4 wave counterpoises), I worked ZL, FO8, KH6 and all over the US. Several observations:

- When it rained, to protect the PFR, I used 3 ft of RG-58 jumper to Emtech ZM2 tuner in a ziplock bag at the edge of the tarp. I wicked the water away from the tuner by tying a foot of nylon line to the wire where it entered the tarp; this diverted the water away from wire before it went to the tuner. I was thinking that I could have used my small (waterproof) 1:1 and 1:4 baluns in the same manner and used the internal tuner. I will bring them next time.

- I found that my 55ft wire would not tune on 40, so I had to use my Emtech tuner to go there. (even tho it tune on 40 at the home qth during a test!) I also noted that the radio played better with the antenna in an inverted L (20 ft vertical,35 horizontal) configuration vs the straight, angled wire going to the tree.

- I REALLY want to figure out how to use my lightweight solar panels to charge the internal batteries. I note the great schematic (pfr3 charge 8-10-08.pdf) in the files section here, but I am not sure of the value of R to use the panels 15.1 V output and my 2500 Ah AAs... This would save me from having to carry the 5lb gel cell! Anybody else here use small solar panels to charge their internal bats?

Last but certainly not least, I had a GREAT Q5 "Yellow to Yellow" QSO with KF7CX - my first. We chatted for a good 20 minutes without a hitch. Thanks Joe!

Great video John, really down to the QRP roots I reckon, inspired, I just went to the Hendricks website and added another PFR-3 to my cart!

I sold the previous one to a Russian colleague of mine, (Arthur RM9WA) here on Sakhalin Island, so listen out for him!

I have a 'nice' K1, but I like the balanced line/BLT option on the PFR-3 and the ease of use in the field (as it was designed for). Also, the K1 is twice the price of a PFR-3 by the time it arrives in the UK...no contest, the 'yellow box' is a great value for money rig that can withstand the rigours of rough field work.

Incidentally Maplin in the UK, appear to have a cheap (30 GBP) version of the Peli case, under the heading of High Impact Case, (always a neat idea for transporting these units).

Thanks for sharing the nice activity report and video John.

I have also had the problem of antennas tuning up well in the back yard

then for some reason they refuse to play when out in the field (or up on a hill).

Favorite antenna at the moment is the End Fed Half wave on 7Mhz,

This I find also tunes well on 10 & 14Mhz with the PFR-3 tuner.

I have a photo's of this years SOTA activations

1029. Poly Varicap C1/C2

Yahoo group: pfr3_group
Date: 2009-09-22 02:15:58 UTC
From: kprice2982
Topic: 1029 Message: 1029

New builder here and maybe a silly question. The instructions call for placing the washer between the board and the poly varicap. Am I supposed to use the plastic washers and the pan head screws to secure this to the board? If the pan head screws, then shouldn't I have 6 of them since I will use 2 per poly varicap and I have 3 poly varicaps (2 x 3 = 6)? I only have 4 of those screws.

Thanks
Keith, WA5LPW

1031. Counting Turns on winding toroids L1 and T1

Yahoo group: pfr3_group
Date: 2009-09-24 16:47:24 UTC
From: K Price
Topic: 1031 Message: 1031
Attachments: 2 described; binary payloads are missing from this source WARC

Working on my pfr-3 and have attached two photos of L1 & T1. FYI ... If the photos don't make it through I will post them on my web-site and send a link. I am trying to make sure that I have counted the turns correctly. My count is the wire that I see "ON" the core. On T1 I have only wound the first 40 turns. I am concerned because the photo in the build manual shows the next part of T1 having a 5 turn secondary winding. When I count the turns in the manual it looks like 4 instead of 5. Is there something I am missing?

Each time the wire passes through the center of the core, that is one turn. Count the number turns on the inside of the core, not the outside. For L1 and T1, having one turn more or less isn't going to be of any importance, but it will be critical when you do the low pass filter toriods.

I did it with 5 turns (counting inside) and my rig works wonders! (I had the same doubt and had a go at a 5 turns option... no probem...)

1034. ssb receive / revisited

Yahoo group: pfr3_group
Date: 2009-09-25 22:25:49 UTC
From: hamradiobert
Topic: 1034 Message: 1034

Group,

Now that the condx are improving and voices can be heard has anyone come up with an easy modifcation or pcb that could be added to the rig so one could listen to some of the ssb chat? The circuity is easy,however, the execuition of the mod is not easy. Any ideas on how to widen the 4.9152 mhz cw filter that could be done in an easy and clever way would be nice. Bert M. Thompson KB3MHB/0 SSN = 2

> >one could listen to some of the ssb chat? The circuity is easy,however,
>the >execuition of the mod is not easy.

As you say, adding SSB reception would not be easy. Not only does the IF filter have to be made wider, but the audio band pass filter has to be by-passed and the BFO frequency shifted.

The easiest way to do it would be to build a whole new IF filter, product detector and audio pre-amp board. Use the tall 4.9152 MHz crystals, as these are easier to make a wider filter with (but will still be fairly narrow due to the relatively low frequency). The unused 1st mixer output could be used to drive the new SSB IF board. A toggle switch could be added to the case to switch the input of the audio amp between the CW and SSB.

There is enough room in the case to add such a SSB reception board along with the battery pack.

OK
My research tells me that one resistor in series with the power out cables will reduce the 13.8 volt in my 3 amp p/s to 12 volts, right? Is it .47 ohms or 4.7 ohms. I calculated .47 ohms but not sure about that decimal point. Didnt research the wattage on that resistor.

Hi Henry,
Lots of guys use a high current power supply diode to drop the voltage by 1.something volts... Depends on the diode.

Hi Henry,

If I wanted to drop from 13.8 to 12, from a AA battery pack, filled with Nicd or NiMH, I would fill one slot with a dummy battery. If I were using an ac fed supply, then a dropping diode might work better for you, actually a series pair might be just the ticket. they would be less suseptable to voltage change due to current changes.

Good Luck,

You might consider also adding a bypass cap such as 0.01 uFd across the the diode(s) because the current will change with transmit and therefore cause voltage spikes although minor - just a nice touch. the diodes are switched on/off depending on the bias - this can cause discontinuities in the voltage.

Thanks Steve this could be a good winter project. I'm baby sitting my grand kids in Denver and have the nites free. Will give it some thought and see if I can get it together. Wish the Hendricks people had given it some thought. The kit is great and I hate to mess with the design, however, get tired of cw and like to listen to voice.

Hey Steve,

Just thought I would let you know I've recently picked up an unbuilt PFR-3 kit. I'll probably be contacting you for some assistance later this year when I'm retired and have time to build.

Well, when it comes to this rig, I am the "Hendricks people", hi. Adding SSB reception would have added complexity and cost to the rig or compermised its primary purpose of being a good CW receiver. Since SSB reception and possible "cross mode" (CW=>SSB) operation is of interest to only a very small number of guys, the added expense of adding that type of feature can't be justified.

1047. baby Black Widow paddle

Yahoo group: pfr3_group
Date: 2009-10-01 15:36:57 UTC
From: kd1jv
Topic: 1047 Message: 1047

A while back I bought a Black Widow paddle from Jerry, W5JH. I really, really liked it, so I got the baby one Jerry designed for the PFR-3. I really, really like this one too.

Yes, it is a little large and heavy for truely portable operation, but it is a solid paddle with a nice feel and good action. It is a good addition to the rig for when your car camping, operating from the local park or in the shack. What is also nice is you can make a simple cable with a stereo jack on one end and a plug on the other to use the paddle with other rigs. Or you could eliminate the back mounting panel and plug assembely, connect a standard cable to the paddle and use it that way.

Jerry tells me he only has about 35 of these left and will not be making more, so get one while you can!

1049. Almost Done

Yahoo group: pfr3_group
Date: 2009-10-03 15:42:31 UTC
From: kprice2982
Topic: 1049 Message: 1049

I am almost done with my PFR3! I think everything is working except the BLT. I get 5-6 watts out on 20, 30, & 40 meters into a dummy load. I can hear signals on all bands. I can NOT get the BLT to tune my nearly resonant dipole. I believe it is due to my poor workmanship on T3. Photos off my work can be seen at:
http://www.keithpricephotography.com/pfr3.htm

I have a couple of questions for the group.

1. Is it necessary to use the nylon washers for C72/73 and C74/75? I used metal washers at the time as I had lost the nylon. Those have since been found but the board is now mounted. Do I need to change that?

2. What does it mean to "fully mesh" the trimmers of C74/75? Am I supposed to adjust some of the screws on the back of the cap? If so, which direction?

3. Is my winding of T3 (see link above) so poor that I should re-work it?

Thanks,
Keith WA5LPW

> used metal washers at the time as I had lost the nylon. Those have since
> been found but the board is now mounted. Do I need to change that?
>

No, it doesn't matter. The reason for the washers is to space the cap slightly from the board, as the hole in the board is slightly smaller than the coller around the shaft of the cap, so the cap will not sit flat to the board without the washers.

> 2. What does it mean to "fully mesh" the trimmers of C74/75? Am I
> supposed to adjust some of the screws on the back of the cap? If so,
> which direction?
>

As you can see in your pictures, there are two "half moons" connected to the screws on the bottom of the tuning caps. These are the trimmers and are currently set to 50% meshed. Fully meshed is when you see a half moon, not a full moon.

> 3. Is my winding of T3 (see link above) so poor that I should re-work it?
>
So long as the wires are in the correct holes and making connection, it should work. To tune 40M, you will likely have to push the primary turns closer together, so thier not so spread out on the core.

To tune a nearly resonant dipole feed with coax, you must have the following switch settings:

1: rear toggle switch handle facing the binding posts.
2. BLT/COAX switch in BLT position
3. HI-Z/LOW-Z switch in LOW-Z position

Now its just a matter of finding the proper settings for the TUNE and LOAD controls, which is the tricky part. Tuning is very sharp, so has to be done slowly. Start with the LOAD control set about mid range. SLOWLY adjust the TUNE control until you see even the slightest dimming of the LED. Now see if you make it dimmer with the LOAD control. Now you need to re-adjust the TUNE control to dim it farther. Work back and forth between the two controls until the LED goes out or becomes very dim. Only very slight tweeks of the controls are needed at this point.

From: kprice2982
Topic: 1049 Message: 1051

Thanks Steve,

Made the changes you suggested and I was able to get the BLT to slightly dim on my dipole (yea!!!). Your description of the settings was especially beneficial as I am sure I had it wrong there too.

On a funny note I have made the 1st QSO with the rig. I was using an external tuner and a 40 meter dipole up 15 feet. I heard a station calling CQ and I answered. He was 599. He gave me a 579. His QTH? 2.5 miles (not a typo) away from mine!!! Ugh. At least it means I am getting a signal out.

From: kprice2982
Topic: 1049 Message: 1052

I am now able to get the led to dim and now have a question about the power out! FYI ... I am using an Elecraft W1 watt/swr meter.

When using the BLT ... Is the power out impacted by the Load/Tune positions? I have noticed that as I am calling CQ that the power out goes up as high as 10 watts on my meter. If I change the Load/Tune, then the power out can drop to 1 watt. When I use an external tuner the power out stays at about 5-6 watts.

Thanks

The watt meter assumes it is looking into a 50 ohm load to give accruate
power readings. Placing the watt meter after the BLT, were the load and
source impedances are unknown, will produce meaningless readings.

To get proper power measurements when using in the BLT, you need to put the
watt meter between the transmitter LPF output and the input to the BLT,
which would require modifications to the rig.

Yes, but they've been back in business for two months, so you should have received a reply.

About two weeks ago I ordered something that they have in stock, but I've heard nothing. It would be nice if they'd implement a system for feedback/status reports as other kit suppliers do.

That said, I have no doubt about Doug's integrity.

Dennis, I just checked my email file and show a message from you on Aug. 26th, and I cannot bring it up. I checked my paypal orders and show no order from a Dennis King. Please tell me how you ordered the kit. Did you do it via us mail or paypal. If you ordered by US mail, would you check to see if the check was cashed. I try to never cash a check until the order is shipped, but I suppose it could happen.

We will get to the bottom of this and will get is sorted out. I apologize for the inconvenience and slow response time, but I don't think I ever read your email in August, must have slipped through. Doug

I expect the same level of response that I get from comparable suppliers, e.g., Dave Benson's SW Labs or W8DIZ's Kitsandparts. Both do an excellent job of communicating, which is my only concern here.

From: ki6ds@dospalos.org
Topic: 1055 Message: 1063

Guys, I am a 1 man operation, and I still have a full time job teaching and coaching. The web site says that the only notification that you will get is the receipt from paypal and that shipment will be made in 2 weeks. I try to keep up with that, and usually do. But there are times when I get back ordered on parts and have to wait for them. If I were to email every customer about the status of his order, the shipping time would be longer, as I only have so many hours in the day. I try to reply to every email that I get, but sometimes they get wiped out in the bitbucket or something and I don't see them. Thank you for your patience and understanding and no replies needed, 72, Doug

My opinion, like everyone has one, is that Doug is doing a wonderful job, and a terriffic service for all of us. We should be a bit more appreicative and a bit less critical.. now if that offends someone.. gee... maybe a mirror would be of assistance.

So, like I said, my opinion really is just my opinion, and after having built a number of the PFR3s, I appreiate his dedication and efforts. Yes, I have had one question for him, and got the answer... which worked out just fine. The other thing that for me, is of much more importance than a fast answered email... is the quality of kit, the number of times that I have had to ask for replacement parts... is very nearly nothing. Nearly.. yes... I lost one. And yes.. I got it replaced. Was it Dougs fault? NO.. did he accomplish it cheerfully and in a timely manner? Yes...

Do I get anything out of building Doug's Kits?... Sure do.. the satisfaction of a good kit working with quality parts and without any concern for it not working at its standard.

Monetarily, no... not at all. Ask around.

Now, I'm going back to makin solder smoke... on another PFR3.

1065. Odd keyer performance on 20 but great on 40

Yahoo group: pfr3_group
Date: 2009-10-07 21:56:11 UTC
From: kprice2982
Topic: 1065 Message: 1065

I was calling CQ today with the PFR-3 and a portable antenna (end fed). While doing that I also recorded the audio on my mobile rig (Yaesu 857 & Hustler Vertical). The sidetone I hear in the headphones is great. That is why I was shocked when I played back the audio I recorded. On 40 meters everything sounds great. On 30 the audio has a slight ripple. On 20 it sounds almost as if I am using a straight key and have made up a new language.

Any ideas on what I might have messed up? Why would it be okay on 40 and retched on 20? Explains why I didn't have any luck with a QSO.

72, Keith, WA5LPW

Keith, sounds like RF getting back inside the rig a little on 30, and more on 20M.

Were you using an external tuner to match your end-fed? A true half-wave on 40M would be about 3/4W on 30M and a full wave on 20M. How did you make up for the radical changes in impedance on each band? Were you using any kind of counterpoise on any band?

Oftentimes, the RF is getting back in through the headphone lead or the key/paddle lead. Please note that these are rather generic suggestions/questions. they are not specific to the PFR-3. But, I believe the tuner within the PFR-3 is a variant of the Z-match, meant for more moderate impedance transformation than you might have with the antenna length(s) and configuration you are currently using.

Keith,

We need more info to make a meaningful guess, like the answers to Bruce's questions. Since the the keying sounded fine via sidetone, the problem is not with the keyer. It is more likely the PA didn't like your antenna load and was going nuts. It's also remotely possable the problem was on the recording end.

So, were you using the built-in BLT tuner and were you able to get a good match as indicated by the SWR LED?

A few hints for using 1/2 antenna with the PFR-3 and BLT:

The antenna length should be about 10-15 % shorter or longer than a true 1/2 wave length. This reduces the feed point impedance to something which the BLT has an easier time finding a match to.

Since 30 M isn't harmonically related to 40 or 20, using a seperate wire optimized for 30M is usually a good idea. Though you can sometimes make a single length wire work on all three bands, this can take some trial and error to find a good length.

In theory, a counterpoise isn't needed with a EFHW, but in practice it is a good idea. A 10-15 length of wire laid out on the ground is all that is needed to help keep everything happy.

From: Jim Ford
Topic: 1065 Message: 1068

I can think of a couple of scenarios. First you might be getting RF back into your rig causing problems. You can check this by hooking up the rig to a dummy load and see if you have the same problem. If you don't perhaps a couple of turns of your coax thru an Amidon FT240-77 or similar toroid core would greatly attenuate the RF on the outside of your coax. The other thing might be your AGC in your monitoring rig is being overloaded causing it to distort what you hear. Test this by totally disconnecting any antenna from the monitor (or any other method to greatly reduce the signal input). If this is the problem then there is nothing wrong with the PFR-3.

Sincerely,

Jim Ford, N6JF

1069. A question or two

From: Irv [K3IRV] McWherter
Topic: 1069 Message: 1069

Hi all:

I enjoy monitoring this group and enjoy the advice provided. I have two questions:

Has anyone tried the NorCal Doublet Antenna as described on this site with the PFR-3: http://www.norcalqrp.org/norcaldoublet.htm

Is the 28 feet of feedline critical for this antenna? I would like to use this antenna with a longer feedline.

Thanks for your help.

From: Jiri
Topic: 1070 Message: 1070

Hi All,
I have problem with Antenna tuner PFR-3. It works on 10 and 14 MHz only, on 7 MHz I am not able to tune any antenna and dummy load. Best is when both capacitors C72, C74 are on maximum, but SWR is too high. I tested ATU only. S9 in position COAX, I connected antenna analyzer to C72, C73 direct and I tuned all antennas and dummy load on 7 MHz well. Could You advise me, what shell I check?
Thank You Jirka OK1DDQ

From: kprice2982
Topic: 1065 Message: 1071

Great responses and many thanks. Some answers:

> It's also remotely possible the problem was on the recording end.

Two of you suggested that the problem was on the receiving side. So I put up a 20 meter dipole and re-recorded. The first test had the same poor results - that being garbage recorded. I then tried a different receiver that was about 70' away. BEAUTIFUL sounding code this time! I went back to my mobile set up and unplugged the mobile antenna and tried again. Once again the code was BEAUTIFUL. So, the problem was on the receiving end being overloaded! You guys are way too smart and I am very thankful!

I also managed a great contact on 40 meters last night using my multi-band dipole. I got into Miami (840 miles) and got a 579!!! I can't believe that I built something that actually works!! This is the most complex kit I have built to date and can not be more pleased. Thanks for all the advice everyone has offered this new builder!

For those interested in the rest of the set up here are some other answers.

>What type of antenna?
The antenna I was playing with came from a friend in the 4 Square QRP group. Quickly it is a 50 foot length of speaker wire with 25' cut off one side. The remaining 25' is left in tact such that the counterpoise is effectively in the air instead of laying on the ground. I have used this antenna before with some fun results on my FT-817 and an LDG Z-11 tuner. More info about the antenna can be found here:
http://www.wa0itp.com/antennas.html#pefz

>Were you using an external tuner to match your end-fed?

I started out with the BLT and then switched to my Elecraft T1. The problem was heard on both.

>How did you make up for the radical changes in impedance on each band? Were you using any kind of counterpoise on any band?

Initially I was having a hard time getting a match on the BLT so that is why I switched to the external tuner.

> So, were you using the built-in BLT tuner and were you able to get a good match as indicated by the SWR LED?

Much to my delight I was able to get it to match on 20 & 40. It did not like 30 but it is likely due to lack of patience on my part at moving slowly. You were right in that you have to adjust SLOWLY to get it to work.

73, Keith

Make sure the trimmer caps on the bottom of the Tune and Load controls are set to maximum capacitance - they will look like a 1/2 moon, not 3/4 or full moon. Also make sure the turns on the core are only spaced around about 1/2 of the core, not evenly spaced around the whole core.

Hi Adrian
the PA-lowpass filter for 40 meter (the 2 coils) try by pulling or widening the space between the turns, this helped me to get 5 Watt out on each band
if no variation, try to remove 1 turn of one coil and see the output change , again "playing" with the distance between each turn

good luck
Jos

Shifting the turns on L9, L11 and L13 CLOSER together will increase power output. I just grap the 4-5 turns in the center of the core and push them close together.

Shifting the turns on L8, L10 and L12 closer together will reduce power output.

L9 could probably use one more turn then specified in the table, but I'd rather it come out a little on the low side power wise and have you adjust it up rather than down. The difference between 4 watts and 5 watts really isn't much on the other end and using 4 watts instead of 5 watts would give you a little longer battery life.

Hi Jos, Jim and Steve

Thanks for your suggestions.

I went for the easiest fix, bunching up a few turns on L9 and L11. Thanks for this Steve. 5W out on all bands now but I take your point re longer battery life with 4W Steve. I will be using the radio on mountain summits in the Scottish Highlands, if battery life proves to be an issue I will space those coils out to drop to 4W again! I know the difference will make no appreciable difference really.

Have had my first QSO with a couple of locals. Great signal reports, great audio on recieve. I like this rig. Thanks for the design Steve.

1079. Fw: SRX1115380891ID - Compatibility with software written for earlier versions of Windows

Yahoo group: pfr3_group
Date: 2009-10-27 16:15:02 UTC
From: Jim
Topic: 1079 Message: 1079

This is being sent to several groups and individuals. Do not think it is SPAM, it is simply the result of an inquiry about the latest Operating System released by Microsoft, Windows 7, and how that OS interacts with some software in use in the amateur radio community. The fourth paragraph gives the best answer. If you currently have and use Windows Xp and have no problem with any amateur radio related software, the options available are to keep using Windows Xp on the same computer or upgrading to one of the higher priced Windows 7 packages.

For the present, I will keep the OS that is now on my computer.

73 to all,
Jim Good KD5VXH

Subject: RE: SRX1115380891ID - Compatibility with software written for earlier versions of Windows

Hello James,

Thank you for contacting Microsoft Customer Service.

I appreciate you for the time taken to write back to us.

Most programs written for earlier versions of Windows also work in Windows 7. If an older program does not run correctly or does not install on Windows 7, start the Program Compatibility troubleshooter, which simulates an earlier version of Windows. You can run the wizard on the setup program itself if the program does not install, or you can run the wizard on the program if it installs but does not run correctly. For more information, please visit the below web link:
http://windows.microsoft.com/en-us/windows7/Make-older-programs-run-in-this-version-of-Windows

You have one more option, which is Windows XP Mode. This feature is included in certain editions of Windows 7 (Windows 7 Professional, Enterprise, or Ultimate) and using Windows XP Mode, you can run programs that were designed for Windows XP. To know more information about Windows XP, please visit the below web link:
http://windows.microsoft.com/en-us/windows7/install-and-use-windows-xp-mode-in-windows-7

If you have any queries regarding compatibility, you may contact our Presales team. You can reach them at: (800) 426-9400. They are available

from Monday through Friday 6:00 A.M. - 6:00 P.M. Pacific Time.

James, I hope the provided information is helpful.

Thank you,

Prakash

Subject : Re: SRX1115380891ID - Compatibility with software written for
earlier versions of Windows

Sujith,

Specific programs that are of interest to the amateur radio community, and
to me, include WSPR (pronounced WHISPER) which stands for Weak Signal
Propagation Reporter, MicroLog, DigiPan, and a few other similar programs.
These programs were written to work with the Windows Xp Operating System.
In some cases, a simple patch was made to update a program from Windows 98,
or earlier, to Windows Xp compatibility. A few software developers have, on
amateur radio reflectors, expressed frustration about being able to update
their software to work correctly with the latest versions of Windows. These
programs are used by amateur radio operators to record (or log) contacts the
operator makes, get information about expected propagation to distant
countries, and in some cases control the radio being used. Some software
developers are writing code to do most of these tasks under open source
protocol and open source operating systems. Should there be delays and
problems getting some of the more useful software to work with Windows 7, as
has been the case with Windows Vista, then many of the amateur radio
operators I hear from would easily switch to some other format for computer
software.

Thank you,
James Good

Hello James,

Thank you for contacting Microsoft Customer Service.

I understand that you would like to know information about backward compatibility of the old software with latest operating system (Windows 7). Please let me know if I have misunderstood the issue.

You may find the information about the compatibility of software with Windows 7 at the following web link:
http://windows.microsoft.com/en-us/windows7/help/compatibility

For more information, I recommend that you contact the Microsoft Microsoft Sales and Partners Information team at (800) 426-9400. They are available from Monday through Friday 6:00 A.M. - 6:00 P.M. Pacific Time. This team will be in a better position to assist you.

If you have other concerns, please do write to us.

Thank you,

Sujith
Microsoft Customer Service Representative

Subject : Compatibility with software written for earlier versions of Windows

CONTACT INFORMATION
First Name: James Good

PRODUCT
Windows

QUESTIONS OR COMMENTS
Message: I am an amateur radio operator and have several programs installed on my personal computer that had been written for earlier versions of the Windows operating system. Some of these programs even support Windows 95 and earlier DOS operating systems. These programs are used to operate in digital modes on the amateur radio frequencies (PSK, MFSK, RTTY, etc.). In light of the problems that many users experienced when Windows Vista was introduced about the lack of support for some programs and product drivers in use by the computer user, what will be the backward compatibility of the latest version? There have been some amateur operators that have switched from the Microsoft family of software to other operating systems simply for compatibility with certain other software and external hardware. With some 600,000 or more amateur operators in the United States, it seems that gaining and keeping that group of users should be important.
Thank you,
James Good

1080. PFR-3 Thanks and Mods implimented

Yahoo group: pfr3_group
Date: 2009-11-01 02:08:20 UTC
From: Frank
Topic: 1080 Message: 1080

Hi:

This note is to thank Steve Weber for the fine rig he designed for we in the qrp community. Also, thanks to Doug Hendricks of QRPKITS for his efforts to kit the PFR-3 and make it avilable to the
larger qrp community.

I chose to make a couple of mods to my version of the PRF-3 which may be of interest.

First, rather than buy the accessory paddles I chose to install a homebrew set at the extreme right
top side (adjacent to the readout). These paddles are permanently mounted and project above
the radio about 5/8", the same height as the various knobs. I did have to drill three holes in the
top portion of the case. Two secure the paddle assemble to the radio and the third acts as a pass thru to allow the associated wiring to enter the case.

Secondly, I'm not great at copying and logging CW so I like to write much of what I hear down.
I built a miniature 'desk' from a piece of scrap plywood. As you will see from the attached photograph it secures to the front of the radio providing a writing surface of about 4 x 5 inches.

Although not visible in the photo a thin 'L' bracket is attached to the back of the 'desk' in such a
way that the vertical projection can slide between the top front cabinet cover and the bottom cover. One can control how strongly it is held in place by adjusting the tension on the two front cabinet securing thumbscrews.

When not using the radio I slip the 'desk' off the radio and store it under the radio to form a very compact shape when travelling.

Hopefully you can find the photo of my mods in the photos section as I see no way to attach them to the body of this message

For me these two mods really make the portable field station I've looked to for many years.

Thanks to all who made it possible.

I wrote him two weeks ago and received this reply on 10/22. k8ar

Ben, the boards arrived today. Waiting on the main chips to arrive to send to Steve, probably another week to 10 days. Again, I am giving a free paddle kit for waiting and being so patient, but if you decide you want a refund, I will also do that. I don't like taking this long but it is unavoidable. Tnx, Doug

Wanted to let everyone know that I am taking my newly finished PFR-3 into the woods for a quick mini-expedition camping trip. My prayer group is heading to the Sipsey Wilderness in Northern Alabama (http://en.wikipedia.org/wiki/Sipsey_Wilderness) on Nov 6 & 7th. I hope to sneak in some operating time on Friday evening and early Saturday morning. I will work mostly on 40 meters but will also have a 20 meter dipole to try out. I will hang around the QRP frequencies and hope to work a bunch of you. I will create a special QSL / Photo card for the event.

Feel free to spot me on "http://www.qrpspots.com/" as I will not have any Internet or cellular coverage. (Isn't that is the whole point of getting away?!?)

1086. 44' Antenna - Questions about building one

Yahoo group: pfr3_group
Date: 2009-11-14 16:32:35 UTC
From: kprice2982
Topic: 1086 Message: 1086

Within this group I have seen several references to a 44' antenna but can not find additional information about building one. I think this antenna is also the same one described in the current QRP Quarterly issue. That article mentions using ladder or window line as the feeder. My questions for the group include:

1. What length of feeder line is the best for using the 44' antenna on 20, 30 & 40?

2. Is the 300-Ohm Flat Twin-Lead Cable from Radio Shack a descent feed line?

3. Any guage wire better/worse for the 44' section (e.g. speaker wire vs. #12 stranded)?

4. Advantage/Disadvantages to this antenna?

Thanks in advance.
Keith, WA5LPW

If you are referencing a vertical antenna look at this months QST, the article by Phil Salas AD5X on the 43' vertical for 80 and 160.

Or for a wire antenna that will work on 30M - 15M [including WARC bands] go to http://www.w5fc.org/files/how-to/QRP%20Expressions_version_1.pdf and read my article "A Winning Antenna." I published that in 2005 on the Internet and it is now in in use in over 30 countries. It is a detailed construction article. That antenna is 66-feet. I'm not sure what source you are referring to as a 44' antenna and what bands it's designed for.

1094. PFR3A Availability Announcement

Yahoo group: pfr3_group
Date: 2009-11-15 20:52:00 UTC
From: KI6DS
Topic: 1094 Message: 1094

Finally, I have a firm date on all the parts needed for the return of the PFR-3 radios, which will now be known as the PFR-3A. Steve redid the board and fixed some minor glitches that were bugging him. The board has new software that is NOT backward compatible to the PFR3. It is different because the new board required it. So no, you don't need to upgrade your software in your atmel chip.

The kits will be ready to ship the first week of December. Now the bad news, I have to take a price increase of $25. There is a special offer for anyone who orders between now and Dec. 1st. I will honor the old price of $200 for the kit. The price will officially change on Dec. 1st. So if you are thinking of ordering, don't hold off, so you won't be hit with the price increase. You may order by going to the website and clicking on the PFR3 picture. Dean will keep everything the same on the pricing until Dec. 1st. Steve will have the new manual up in a few days, well before the kits ship.

Thank you again for your incredible patience and support on a great Steve Weber design. 72, Doug

Perhaps the case will grow on you, given all the black, gray and green rigs we typically own. Mine has the W5JH paddle attached, and its red parts adds to the red buttons on the rig. That aspect should fade into the background - and if you still must paint it its not that dreadful to take off the knobs. But this professionally baked finish should hold up better than other paints on top of it. 73 Curt

Hello John,

Yeah, I sort of had the same opinion when I first saw it as well.
The old Gonset Goonie Box with the CD logo on it came to mind. ;>) I have a Photo Shopped picture I should upload of my "artistic rendition" of the "CD PFR3". ;>)
When the rig was conceived the idea was to have a rig that could be a self contained station in a box for back packing: thus was born the "Pack Friendly Radio = PFR" and the color was chosen for ease of being able to find it in your back pack and your tent at dusk or in the near dark as well as keep it cool when you operated during the day outside. Not as much Solar heating issues as a Black or dark Grey rig.
My personal choice would have been a matte sand blast finish that was hard anodized to the medium blue that is used on many race car and bike accessories with stamped or engraved lettering but the cost of that case would likely have been at least double or even triple what it cost to make it the first place.
If I had the time and talent to do the job myself it might be fun to get a case and re-do the finish that suits you just as an example of what could be.
BTW, the more you use the rig, the more it will grow on you.
Yep, my W5JS paddle has its place on the front of my rig as well: SN#1, and Jerry does a very nice job with his kits.

It also is a lot less drifty than a black box out in the sun. It sticks out
well so you
don't forget to put it back in your daypack on outings. It is also a PRE
PAINTED
case for a kit that cost well under some of it's competition. Once you
operate
with it, you are going to forget about it being yellow.

About the Yellow phenomena,

I found a pair of yellow headphones......

and I am painting a CW key base yellow.....

With the decals and knobs and switches on, I think of the case as bright and unique. The yellow is yellow, but as a radio it is not so stark like the empty box/kit.

Yeah, the yellow grows on you....

now you've got a radio that color coodinates with your old Gonset and your Civil Defense Radiation detectors..... and your post-it notepads, and your rain coat....and your bananas.

I LOVE the yellow. I must admit that it helped to sell the kit to me. Yes, I thought of the CD Gonset when I ordered it. I had to apply a CD logo sticker on it. Check out my photo album, PFR-3 with authentic cold war relics (radiological survey meter, dosimeters, dosimeter charger, and original fallout shelter sign). You may note that the color scheme is quite similar indeed!

You can get your very own vinyl Civil Defense stickers at:

http://www.zazzle.com/civil_defense_circle_sticker-217369113637416262

If you want a little variation, they also have one in yellow (not blue) it would look super nice on the PRF-3:

http://www.zazzle.com/civil_defense_yellow_logo_sticker-217259830020465216

The 1.5 inch size is what I have on the front. But I am thinking about a 3 inch sticker on the back of a fallout shelter logo:

http://www.zazzle.com/fallout_sticker-217486074710474943

Even neater than the fallout shelter logo is the "Alert today, Alive Tomorrow".

http://www.zazzle.com/national_civil_defense_week_sticker-217855099276663403

You do have to buy a full sheet of stickers (20 1.5" or 6 3").

I have a few "blue" CD logo stickers left, perhaps I'd trade for another style (i.e. I send you a "blue", you send a "Alert today, Alive Tomorrow", etc.). Get a sticker trade going, maybe even a few logos will but up for grabs?

From: w3bboqrp
Topic: 1121 Message: 1121

Okay, I have to join in this discussion.

I've uploaded a picture of my yellow boxes. Front row shows the PFR-3, my 20 meter Sierra, and a NEScaf audio filter. Back row is a homebrew power supply which provides regulated 9 and 12 VDC, plus variable 0-18 DC. Next to the supply is a new and nifty Four States EZKeyer.

Remember, be mellow, use yellow!

Hi John,

Don't worry, there are still feelings that are evident in the choice of the color.. and you have a choice too.. and that is what it is all about. I really didn't think I would like the bright yellow.. until I thought about it.. and considered that I, who is well known for walking off or away from something, in the wilderness.. then spending the next three days.. with luck, only one snow storm, and a bunch of wind.. hunting for it.. and breaking camp, packing up... late of course.. only to suddenly remember that I had been on the air... and pack the antenna.. but what happened to the radio.. it was layin.....

So.. the yellow helps a lot with that.... particular problem.. the other thing that is pretty neat.. ...*G*... I don't even have to turn on the light in the ham shack to find it... even after midnight. *G*

Seriously.. and on another point you made... an offer if you want. After you finish the build.. and you're having trouble that you don't want to chase... or need help with..

just ask.. there is a lot of folks that will be very happy to help.. and if you want, I would be happy to check the radio.. repair if needed, run the specs on it.. and return it. You would be held to the shipping, only.

So.. don't be discouraged... it is a fine radio.. and builds great. Yes.. parts are hard to see.. I use a lot of different glass to help out with that...

Good luck, and with the yellow.. it is an unmistakeable... totally!

--... ..---

Dale - WC7S in Wy

John,
If you can, try printing or copying the Parts Placement Overview onto 11x17 inch or larger paper.
Printing is probably clearer than an enlarged copy. Might want to take it into Kinkos or another print shop.
It makes a WORLD of difference.
Dick

Topic: 1126 Message: 1126

Anyone else run into this on the "A" model? It appears that I have two extra 10uF electrolitics and one extra 22uf but I am short a 100uF.

If a 100uF is required I might be able to get one locally at Radio Shack but New Orleans isn't overflowing with electronics parts houses. Might have to wait until I get back to Denver next week.

ABV.BG is a Bulgarian website that provides an email service. This message is an automatically-generated response that's gone wrong somehow. I've been seeing it for a while. Not much you can do except possibly have it filtered and redirected to your trash.

1130. PFR3A info

Yahoo group: pfr3_group
Date: 2009-12-14 02:56:28 UTC
From: wb5qyt
Topic: 1130 Message: 1130

Hi Group,

I'm enjoying building my new PFR-3A.
I don't have a feq. counter, so I'm trying to hear a signal out of U7 with my receiver, with no luck. Display works great. I checked for bridges and bad joints....seems ok. Tips, suggestions please.

Thanks to both Doug and Steve for supporting QRP.

72, Tom Wb5qyt

PS: Doug, are you ready to go back to Riley?

1131. Re: [pfr3_group] ABV.BG автоматичен отговор - my guess

Hi Scott,

I am working with a fellow that makes an encoder that is rotary.. we are working up a mod for the PFR3 that would provide a knob for freq control. The radio itself is controlled by a mico-P that accepts up and down controls from the switches.. and menu selection by the same manner.

Hi Dale,

That sounds interesting...I don't imagine it would make any difference to the tuning increments but it might be a little more intuative...not that the buttons would not be after a while. i remember my old FT-707 external vfo had buttons that tuned like that--worked great.

Hope to get burning solder soon. May try and get out and do some portable qrp this winter when skiing. Also, is the lettering on the yellow box pre-installed or do we have to do all the lettering?

regards

scott

Hi Scott,

The later kits have the water slide decals... and a close look at the on line manual is all that is needed to position them properly. However.. I've found that a couple coats of clear coat really improves the longevity.. there are two sets of decals.. so they can be replaced if needed.

Maybe solder smoke will be flowing quickly?

There is a Battery Status Indicator kit that is pretty nifty inside the PFR3 too... that can be added later no problem too.

I'm sure you will have a lot of fun with it... they have very good sensitive rx..and the tx is a nice one.

Have fun, and Merry Christmas,

1136. PRF-3A manual errrors

Yahoo group: pfr3_group
Date: 2009-12-17 16:51:43 UTC
From: Steven
Topic: 1136 Message: 1136

Corrections to the PFR-3A manual are slowly coming in and for the most part are minor things like typos and calling the processor U6 and the DDS chip U7, while in fact its the other way around.

However, there is one mistake which can cause a lot of confusion and that is the inital frequency coming out of the DDS chip. The manual says it is 2.114 MHz (for low side LO injection), while in fact this was changed to high side injection, so the frequency is now 11.945 MHz.

I am making the corrections to the manual and will be sending it to Doug to replace the one on the web site soon.

72, Steve KD1JV

1137. Re: Why Push Buttons for tuning?

From: Steven
Topic: 1132 Message: 1137

There are several reasons for PB tuning.

First, it is much easier to use PB tuning when all the controls are on the top of the rig instead of the front. For the most part, all the controls on the top of the rig are "set and forget". You only need to twiddle them when changing bands, or occasionally change the volume.

Tuning is something you do all the time. If a tuning knob was mounted on the top of the box, it would be clumbersome to spin it, especially if it didn't have a big knob. Which there simply isn't room for.

Also with a top mounted tuning knob, you would have to have your arm rised to use it, which can be tireing. With the PB tuning you can rest your arm on the table and operate the switches with the tip of a fingure, which is a lot more comfertable.

The other reason is the way the switches are connected back to the processor using one I/O port and a resistor divider. Trying to interface an encoder with this method is a nightmare.

Finally, there just wasn't room for an encoder and a place to put a knob which wouldn't get in the way of operating the other swiches or obsucre the display.

Minor items - Group 2 list doesn't include R1. Color coding for R6/R7 incorrect. Question....on the 3A schematic the voltage to U3 and U4 now says "D.C. In". I believe on the 3 it called for either 5 or 6 v. from the regulator. Will this make a difference on the pin voltages?

Steve,

I'm not sending you this email to be critical or snyde. For what it's worth... I just want to pass some information on to you that I learned many, many years ago (Back in the 60's or 70's) from an episode of the TV series "The Odd Couple".
In this episode, Felix Unger points out to a court judge that when you ASSUME, you make an ASS of U and ME.
Since then I have always made it a point never to use the word ASSUME or any of it's variations. However, I do allow myself the luxury of using the word Presume from time to time.
73 es Seasons Greetings...
Dick NY4FL

BTW, thanks for the info in your email to the group. I'm still waiting for my PFM-3A to arrive, and for future reference I have been collecting the emails of everyone who has found problems.

Hello Dick,

FB on your language skills and good for Felix.

You'll also find that there are also parts that come with the kit which aren't listed in the parts inventory. It's nothing serious and things like these are easily omitted but do be sure to save the extra parts. I'm just finishing the receiver and have used some of those "extra" parts so please don't ASSume that they were included in error.

It's a great build and a very neat radio! I have the PFR-3 and it has a fine receiver in it. You may need to take a look at the schematic when building and preparing T1. Again, just little things that might be a small bump in the road. Steve

I am currently building a PFR-3A for a friend. I have the receiver together but without R2 or C28.

Okay, looks like those two parts didn't find thier way onto the table. As a rule of thumb, if its shown on the layout diragram it goes there! That's one area I make sure is 100% correct, as thats the only thing I look at when I build a radio. Just give me a bag of parts and a diagram showing where they go and I'm good.

Well, with the help of all you nit-picking proof readers, we'll get this all fixed up. Too many blurry eyed, late nights working on the manual for me to find them all!

Depends on whats making it change. If the VFO frequency shifts on transmit, then no. If its picking up the transmit signal and overloading the one coming from the VFO, then maybe, but it won't be easy. Try sheilded wire to the counter input first, if you not using it already.

1161. Will there be another manual revision?

Yahoo group: pfr3_group
Date: 2009-12-19 07:42:31 UTC
From: o2jmpr
Topic: 1161 Message: 1161

I'm wondering if there are any plans to put out another manual. I know the most recent one is only a few weeks old, but there are still several errors in it. Not to be harsh, but it seems a little more attention to detail and a little further explanation of some steps would sell a lot more radios.

As a new operator and minimalist, this is the "rig of my dreams". I've built a Rockmite kit and couple other tiny projects, but without a lot more hand-holding in the instructions, (especially when it comes to alignment), and no local elmers to help me out, I have zero confidence I can successfully build this and therefore refuse to buy it.
So, if anyone knows anything regarding the possibility of some more elaborate and clear instructions, I would sure appreciate a response! If all else fails, I would like to know what Dale (or others) are charging to build and test this kit for me.

Thanks everyone es 73!

Howdy, Derek, Please don't hesitate to build one. I am convinced the group will help you.
The minor faults in the tutorial shouldn't be be too high barriers to stop you from building.
I have been among the very first builders of a 'Yella' one.
The best chance is to go along with some others who actually build the rig - so you will get up to date assistance, for sure.
Write your own 'construction diary' and don't be shy to publish - good results, efforts, bad luck, contribute to the picture gallery.
All your personal experience will help the next builder.

To all in the group:
Have a Merry Christmas and a Happy New Year.

1165. RE: [pfr3_group] Will there be another manual revision?

Yahoo group: pfr3_group
Date: 2009-12-19 16:19:25 UTC
From: Dale Putnam
Topic: 1161 Message: 1165

There is another option available, for those that have a problem with the current manual, lack of tools, equipment, maybe have a situation that doesn't allow building.. eyesight... or a vet that wants one...

Ok.. get the idea? Here's the way it works...

Order from Doug, ship it to me, we'll discuss the options, you make the decisions, I'll do the build, and you get to pay for the shipping back to you.

Done deal. Happy Hams Helping Hams.....

Now, I do align it, write the specs up, and normally ship out a ready to use outta the box radio, that is quite a package... occasionally I will ship out a completed board, with the decals to be put on the box... or custom build parts of it... or add the options like the really nifty BSI that Doug has... I'm in the process of working a charger up for the internal batteries, and an encoder for the rotary input of freq selection along with the buttons.

So.. maybe the manual needs some attention... and that's fine. However, let's not let that stop someone from getting on the air.

Merry Christmas,

Corrections to the manual will be forth coming. Rember, this is a hobby, not a full time job, so we do what we can, when we can do it.

Well over a 100 hours has already gone into writing that manual. Anymore attention to detail and it would never get done. One has to make the assumsion that the builder has at least some basic skills and is intelligent enough to figure out any minor mistakes which might creep into the instructions.

As for calibration, the only critical thing is adjusting the BFO freq to match the sidetone and that can be done close enough by ear. The other calibration steps can be skipped over and are only included since they are easy enough to add to the firmware and if you have the equipment to make those adjustments it does slightly improve the performance of the rig. But the default values are close enough that you might not notice any difference between doing that and not.

Steve,

I would like to thank you for all you do in the way of service to the ham radio community. The PFR-3 that you have created is amazing.

My full-time job as an architect requires that I develop "manuals". We call them construction documents. They are never perfect. We aim for that but end up with what we end up with, and are adaptable and flexible in achieving the final outcome.

Please accept my gratitude and appreciation for all your efforts.

Best Wishes and Happy Holidays to You and Yours,

Jim Lacy

From: Dale Putnam
Topic: 1161 Message: 1170

I am very pleased with the manual, Steve, it assumes that there is a bit of knowledge here, and doesn't insult my lack of technique, or anything else.

It is a very pleasing radio to build, as is the AT3 series. And both are exceptional in performance.

Thank you many times for all the effort you have obviously put into these, for the hobby. a Happy Ham Helping Hams, absolutely!

Thank you and Merry Christmas,

From: o2jmpr
Topic: 1161 Message: 1171

I absolutely meant nothing negative in regards to the manual. I hope it wasn't taken that way. I just meant for new folks like me, with little building experience, it seems more difficult than probably need be. That may (or may not) be limiting some radio sales as I assume your demographic is hardcore CW QRP kit builders (who of course already know what they're doing) and new folks like myself who are drawn to this type of rig as a beat all, end all solution to our operating needs all in one box!
I also TRULY appreciate all that Steve and you others do for this hobby! I'd never get anywhere were it not for such helpful folks like you to turn to and chat with on the forums.

With that said, I think we can close this thread out unless someone wishes to continue. I've decided to happily and patiently wait for the new manual revision and I will surely purchase the radio at once and get started. Dale, if need be, I will contact you. Your offer of help is just amazing!

Thanks everyone for helping out so much.

73 all.

From: o2jmpr
Topic: 1175 Message: 1176

Wow, Talk about service! Before I could blink, the manual was updated and specifically answered my question. Feeling much better about being able to do this now.

With that said, if I may prove my ignorance with one last little question in regards to the Group 2 test. It says to connect the BNC across R1 to set up a temp antenna with Q1 being the signal side. Is that line just for reference, or do you need to wire the leads from the BNC across R1 in a specific way. I'm thinking it means to connect the center of the BNC to the Q1 side and the ground tab of the BNC to the opposite side.
Please tell me if I got that correct and thank you again for all your patience with me as I learn!

73,
Derek

I got mine today in Calgary (Dec.23) as well Carl. Got GSTed also.
It is under the tree as Santa has to buy his own best gifts at this age, hi.
Don't have to go back to work berfore New Years so....
Maybe we will do a VE3 to VE6 QSO by PFR x 2 sometime.

Hello Jirka,

Yes, you may use the Li Pol battery, with 11v instead of the 12 with no problems, using a one volt less battery, will drop the tx power slightly. Other considerations would be a concern of charging, or a care during charging. It may be possible to optimize the output to 5 watts, with very careful adjustments of each of the toroids per band. I've adjusted them during optimization for 12v, with a focus on current, so getting to 5 watts out with 11 would be likely. Would like to hear about your results,

Good Luck,

and Happy New Year,

Hi

chances are if you 'optimized' pwr output for 12 you will not be able to realize too much more out of the toroids at this stage. That said, the rig will work great at 11 volts and I doubt you would notice much difference in performance from the 5 watts down to say 4.5 watts.

More important, however, is your Li cells will stay closer to 11 volts much longer than those running other types of cells who will pass by the 11 volt mark soon on their way down--but still keep working. Steve designed the rig for just this sort of flexibility in pwr supply options...I amazed myself over the holidays when I was building the rig and only had a 9v battery plugged in...I heard a G3 call cq so for fun I called him...to my amazement, her called back! too much fun...

1192. PFR-3A R48

Yahoo group: pfr3_group
Date: 2010-01-06 03:16:48 UTC
From: ny4fl
Topic: 1192 Message: 1192

Hi Guys,

I just ran into a problem and I don't want to jump to any conclusions, so I thought I'd check with you before I went ahead.

When I got to the group 5 instructions I found that I did not have a 470 ohm resistor in the parts bin. All I had left was a 1K and the 3 large 2 watt resistors.

The instructions and schematic both call for a 470 ohm resistor for R48 and R3, but the parts list only calls for 1 470 ohm resistor which I have already used for R3.

I was able to find a 470 ohm in my junk box, but I want to make sure I am not misreading something before I install it as R48.

I suspect some kind of typo or parts error, but I don't see any earlier email regarding this problem from anyone else.

Any info will be greatly appreciated.

Thanks,
Dick, NY4FL

1193. RE: [pfr3_group] Will there be another manual revision?

1197. Antenna Connector Spacing

Yahoo group: pfr3_group
Date: 2010-01-07 05:07:54 UTC
From: jim.ford15
Topic: 1197 Message: 1197

If there is ever a need to change the box design I vote for making the spacing on the banana connector at .75 inches which is standard for all dual banana to bnc adapters, etc. One could then easily add additional antenna components and do testing easier with that standard spacing.

Thank you,

Jim Ford N6JF

1201. display question

Yahoo group: pfr3_group
Date: 2010-01-08 13:36:57 UTC
From: brian_w5ye
Topic: 1201 Message: 1201

I had to replace the original display with a new one, and in doing so, one of the solder pads came loose. The associated pin is the extreme upper right, as you look at the display (or upper left from the bottom side). I cannot see where this pin connects to any other component (no trace lines). When I apply voltage, the display shows "60.00", momentarily, then a "A" on the far left. I have re-checked the other solder connections on the display, and all appear good. I am not sure if the missing solder pad is the problem, or something else. What should I check? Any help is greatly appreciated.

Yes, high side LO injection is used on 40M so the signal changes tone in the opposite direction from rigs which more commonly use low side LO injection.

From: orangelite
Topic: 1209 Message: 1209

Hi! - I see that there is a flurry of new activity here with the arrival of the "3a" - I thought I would jump in and restate something I reported last year:

When I first used the built-in BLT, I was disappointed that I could not get the tune light to darken on certain bands (especially 40) with my full sized G5RV. After using the rig a bit, I realized that even a SLIGHT dimming of the "SWR" indicator indicates that the antenna is in the ballpark. Yesterday I got on 40 with the PFR and worked all over the US in the NA QSO party. My LOAD & TUNE controls were fully counter clockwise (LOW Z was best for my ant) and my SWR was 1.7:1 - I could BARELY notice the dimming of the SWR light. My "word to the wise" is that the BLT works better than you think it does at first glance.

1210. Re: my display problem

Yahoo group: pfr3_group
Date: 2010-01-11 20:22:59 UTC
From: k6jf_radio
Topic: 1207 Message: 1210

Brian,

Is the pad you lost on the bottom of the board or right under the LED display device? I don't have a PFR-3 so I cannot directly see the layout. I am guessing the you burned off the pad on the bottom of the PCB. Is this the pad that is not connected to any other traces?

If so the connection of display pin 8 to U7 pin 13 is made through a trace on top of the board. If the bottom pad is missing it would seem that pin 8 of the display is floating with no connection. Is there continuity between these two pins using an ohmmeter? If not add a jumper on the bottom of the board between pin 8 of the display and pin 13 of U7.

I too have been guilt of being overly aggressive with solder iron heat on these small pads. I've had to resort to jumpers to repair the problems.

1211. Power low on 40mtrs only - 1.4 watts

Yahoo group: pfr3_group
Date: 2010-01-15 19:42:14 UTC
From: Sheldon
Topic: 1211 Message: 1211

Final transmitter testing on the completed board showed 1.4 watts on 40 mtrs, 5 watts on 30 mtrs and 4.5 watts on 20 mtrs. Pwr supply voltage is 12.1. I triple checked the number of turns on L8, L10 and L12 counting only inside passes through the core. Also checked L9, L11 and L13. All turns are as specified in the current manual. Windings are spaced as far apart as possible and appear even. I tried tightening and alternately increasing spacing several times (as suggested in the manual) with little impact. 40 mtrs should be putting out 5 watts. Any clues on why it may only be producing only 1.4 wats? Thanks

Sheldon
k2men

note: the receiver works fine.

Yes, make sure the cap across L9 (C62?) is indeed 68 pfd and not 680! If its is marked 680, that usually means its 68 p, but sometimes it means 680 p and if Doug happend to get some marked that way, it could impact others, so let us know.

72, Steve KD1JV
Final transmitter testing on the completed board showed 1.4 watts on 40 mtrs, 5 watts on 30 mtrs and 4.5 watts on 20 mtrs. Pwr supply voltage is 12.1. I triple checked the number of turns on L8, L10 and L12 counting only inside passes through the core. Also checked L9, L11 and L13. All turns are as specified in the current manual. Windings are spaced as far apart as possible and appear even. I tried tightening and alternately increasing spacing several times (as suggested in the manual) with little impact. 40 mtrs should be putting out 5 watts. Any clues on why it may only be producing only 1.4 wats?

Hi Folks,

Some may already be aware but i thought i would post this anyway. If you are like myself, you may prefer an external speaker from time to time. While the rig is more than capable of powering a speaker direct, I found a great solution for this rig. The speaker is designed for your ipod or mp3 player and is really small but provides big sound. Its a about an 2 inches total across in size and about 1.5 inches high until you unsnap it and the belows push out. It works great with the rig and recharges on a usb port. The speaker is an iHome IHM7 and costs about $20...I will try and get a pic up later but you can see a review here...

Scott,

Can you "tune" this speaker by extending or compressing the flexible tube?

1216. problem with C22 and C23

Yahoo group: pfr3_group
Date: 2010-01-16 15:41:18 UTC
From: Simon Stedema
Topic: 1216 Message: 1216

Hi,

I received my kit thursday and now i am busy with group 2 assembly. The 2 capacitors C22 and C23 (0.01 uF, film) are too large. The housing of these capacitors is 12mm high (=about half inch) now the pcb will not fit in the cabinet. There is no room to bend them sideways because of the volumecontrol on the one side and U3 on the other side. What to do? Mount them on the other side of the pcb?

Best 72 from the Netherlands,

Simon, PC7A

not so much tuning as limiting the bass...sounds full when extended--not a huge deal for cw, mind you.

1220. Group 2 tests

Yahoo group: pfr3_group
Date: 2010-01-17 00:41:52 UTC
From: KO0D
Topic: 1220 Message: 1220

Getting back to my hotel room assembly. Group 1 tests are all ok. Can't get the receiver to work. I can hear the white noise and control the volume. I get a 60 Hz hum on pins 4 &5 of U1 and U2 when touched. C1/C2 doesn't have any effect on the white noise. U1 & U2 voltages are a little low on pins 4 through 8. Voltages on pins 5 through 7 are about 50% high on U3. Pin 8 is double. On U4 pins 5,6 & 7 the voltages are about double. DC supply is 12 volts. Output from regulator is ok. All the tuning switches, keyer and displays work ok. Any suggestions?

Double check T-1 windings.

BFO working? Can you beat the control with the sidetone?

Last resort work through the stages with an antenna lead or signal
source to spot the stage where the failure is.

Sheldon,
I used a yellow mono marked 680, for c62.
The instructions say c62 is a disk npo, which was not in my parts.The only 68 pico in the bag of parts was a yellow mono marked 680.
I don't know if using a COG instead of a NPO will result in any temp related issues. It hasn't so far
Maybe Steve can lend some insight in the matter
Hope this helps.

Sheldon,
I would think It has to be in the low pass filter for 40 meters.
Maybe you have a solder bridge under one of the band switches, but I would think that would affect power on one of the other bands as well.
Are you using a 50 ohm load, what is the swr on 40 compared with 30 and 20.
What is the power on all three bands when in tune mode?

Bill,

Thanks for the reply. No solder bridges. I have an MFJ autotuner which I set to 1.0 swr on each band before testing the PFR3a. Here’s the power output:

40mtrs 1.4W

30mtrs 6.0W

20mtrs 5.0W

My caps were both the yellow monos, 68 and 680pf same as yours.

The power on 30 and 20 changed noticeably as I adjusted the torid gaps on L8, 10 and 12. But no change on 40. I connected coax directly to the board, so I am not using the BLT.

My eyes are starting to cross from looking at small components with magnifying glasses…..

If you have a scope, look at the input to the 40 meter filter, and compare to the output.
You can compare it to the other bands.
Then each stage of the filter.
You should be able to see what stage of the filter is causing the problem.
Outside chance you have a bad toroid, or maybe wound with #30 wire by mistake?
Your probably not feeling good about the problem, but this is the fun part of building this stuff, and u will fix it.

Thanks for your quick reply. No
luck, though. C62 is 68pf (yellow marked 680) and C61 is 680pf (yellow marked 681). I pulled them off the board and tested them with a Mastech multitester (.068 and .680 nf). That's what the
instructions call for as you noted. Any other suggestions?

Subject: Re: [pfr3_group] Power low on 40mtrs only - 1.4 watts

 Yes, make sure the cap across L9 (C62?) is
indeed 68 pfd and not 680! If its is marked 680, that usually means its 68 p, but sometimes it means 680 p and if Doug happend to get some marked that way, it could impact others, so let us know.

72, Steve KD1JV

Final transmitter testing on the completed board showed 1.4 watts on 40 mtrs, 5 watts on 30 mtrs and 4.5 watts on 20 mtrs. Pwr supply voltage is 12.1. I triple checked the number of turns on L8, L10 and L12 counting only inside passes through the core. Also checked L9, L11 and L13. All turns are as specified in the current manual. Windings are spaced as far apart as

possible and appear even. I tried tightening and alternately increasing spacing several times (as suggested in the manual) with little impact. 40 mtrs should be putting out 5 watts. Any clues on why it may only be producing only 1.4 wats?

1227. New batch of PFR-3 Baby Black Widows are hatching

All,
Just before Christmas I ran out of baby black widow paddles. I just got more parts in this past Thursday. so, if you are interested in a new baby black widow paddle for your new PFR-3, take a look at:

http://www.w5jh.net/BBW_PFR3.htm

I also have BBW paddles for the elecraft KX-1.

Thank you for good idea. But in PFR-3 is bad algoritmh for CW. It is unpossible to use speed more like 28 WPM. Sorry. It is the same problems like in ATS-3B. Try to exchange firmware with W1KM software. It is really much better.

This is the exact same problem I have with my PFR-3. I've rewound the toroids in the 40 meter section, checked the caps, replaced the caps, replaced the toroids, basically rebuilt the 40 meter section of the low pass filter several times and I still have low power (about .75 - 1 watt) on 40 meters. I finally gave up and ran through the BLT even when using coax. Going through the BLT, I can get 5 watts out on 40 meters.

Bill and I built our PRF-3's about the same time and experienced the
same problems. I ran a lot LtSpice models of the LPF and redid what
seemed like a hundred Toroids. I never could get the power up on 40
meters. Like Bill, I run through the BLT and get four to five watts on
all bands. I keep thinking I should send the rig to Steve and let him
find what I can't.

Stew and Bill,

Thanks for that feedback. I will give the BLT angle a try tomorrow. Fyi, I checked the filters L8 through L13 for continuity and proper function of the switches. Zero ohms from C58 entering S5 (first band switch) through S6 (second band switch) and for each band when moving both switches among bands. No unintended continuity between filters and no shorts to ground. No apparent problems between the filter outputs for each band and the coax point on the board.

I will send it back to whomever if I can't resolve it 100%. Thanks again.

Sheldon

Hi Steve,
I'll be happy to send my PFR3 to you. Would you like it to be in the
case or not? I'll need a day to document all that I have done to isolate
the problem.
Are the fees still $35.00?

Steve FYI,

After selling my first unbuilt PFR-3 kit and then realizing I really wanted to build the rig, the PFR-3A was ordered and built.

I'm seeing 3.5 watts out on 40 and 5.0 watts out on 30 and and 5.5 watts out on 20. In the tune position using the el cheapo Radio Shack SWR/power meter and my dummy load, I see a little less than 1 watt out on 40 and right at 1 watt out on 30 and 20.

It's really not a deal breaker really but having full power on 40 would be nice.

Hi all:
Before sending the rigs in for repair - I am guessing here but first try a real 50 Ohm load - not a tuner - to be sure there isn't some sneaky reactive component fooling the output filter/matching. The BLT should be able to take care of most of it of course. I made a simple but good 5W load for testing 27 MHz radios years ago with a 47 Ohm 2w carbon resistor soldered into a PL259 - an adapter gets you to BNC. (PS also make 100 and 200 Ohm ones to check your SWR meter for 2:1 and 4:1 readings). One might try a variety of Rs too. I have an MFJ 993 and it is an excellent tuner but not sure it might not tell a fib or not match ok at these low power levels.

Also the scope suggestion is right on, 40m is so close to 30m the levels should be similar. A scope (50 MHz) using P = Vpp squared/ 8R should be a check. 45 Vpp is over 5W into 50 Ohms. A QRP wattmeter would be even nicer.

I did some testing on my HW8 in the boonies using a simple Ge diode (a 1N914 or 4148 Si at these levels would do) in series with the (analog) multimeter on a low V range as an RF probe. (a .001 uF cap can be added to gnd. at the meter). Compare the pulsed RF at the FET drains (TX filter inputs) on all bands and also the filter mids and outputs. I would also be tempted to try the 30 filter on 40 by doing some creative temporary soldering.

Has anyone measured the uH of each toroidal inductor so I could model the filters?

1237. Koss "The Plug" ear phones a good match for PFR-3?

Yahoo group: pfr3_group
Date: 2010-01-19 12:26:03 UTC
From: w0ese
Topic: 1237 Message: 1237

I'd like to get a pair of ear phones that are a good match for the PFR-3. I've noticed that Koss "The Plug" model seem to be a favorite for KX1 owners. Specs for the ear phones are as follows:

16 Ohms impedence
112 dB Sensitivity
10-20,000 Hz freq response.

I don't care about the freq response, but the sensitivity and impedance. Does anyone know what the phones output is on the PFR-3?

Just wondering if I 16 ohm "cans" would be a better match than 32 ohm "cans".

Thanks!

JOY at last! I now have 5W out on all three bands via coax connection and the receiver sensitivity seems fine. The solution was to install the correct resistance value on R30. I had incorrectly installed a 100K in the R30 slot and it should have been 1K. That solved the problem completely. I found it when I went backwards from S5b to check the link to U7. (btw S5 on the board is labeled S6 on the schematic)

I really didn't intend to return the rig until I had completely exhausted the group's suggestions and my patience. If I couldn't figure it out myself, then I wanted to learn something about how to troubleshoot by returning it to a more experienced builder.

Thanks to all who submitted comments and guidance. I read every one carefully and it paid off!

Cheers and 72 to all.

Steve,

You have stumped the chump. I don't know the answer. I only know everything works and that's the only component I changed. The only other items I touched on the board were some electrolytic caps to make sure they weren't touching other components. But, I think that had nothing to do with anything. I also removed and reinstalled the coax connection. That's it. I had a qso on 40 this morning and got a report of clear signal with no drift. 5 Watts out, no problem.

Sheldon

Hi Sheldon,

That's great news!

But I'm confused. According to the manuals I have, R30 is the voltage divider for 20 meters band select. It was originally 2.2K on the early models and is now 1K. The proof is in the results but I don't understand how this would have affected 40 meter operation.

1243. Variable capacitor screw size?

Yahoo group: pfr3_group
Date: 2010-01-20 10:24:18 UTC
From: cawlx
Topic: 1243 Message: 1243

Just starting to put the PFR3A together and noticed that I am short a screw for mounting the variable capacitor. Does anyone know what the type of screw it is, size, thread type and length. That information is not listed in the parts list in the manual.
Thanks
Carl

Fred:

In case you're interested, the 3 screws that were missing (one for
mounting the variable capacitor to the panel and one for each shaft)
are 2.5mm machine screws. The panel screw is 2.5 x 4mm and the shaft
screws were 2.5 x 15mm when using the longer of the nylon spacers.

I found the screws I needed at a local hobby shop that caters to
radio-controlled model builders.

Cheers,
Rob

Ask the man you bought it from (Doug Hendrix); he's always been very helpful.

It's also been in previous postings, so you could do a search of the archives (check qrp-l archives also).

Thank you for your reply. I had sent Doug a question on another problem, which I have not received a reply for yet. Which is why I asked on the list about this one.
The problem for me is the parts list which is in the PFR3A manual is not complete, or accurate. Which makes it hard to know if you have everything before you start.
On a positive note I have completed the first test of oscillator and microcontroller and it passed, so it is on to the receiver section assembly.

All:

I have built the Hendricks Kit BLT+ and it uses the same screw that I used in my first PFR-3. The material list there calls out this screw to be a "3 X 2.6 mm Pan Head" screw. This should help to get the screw sizes needed even if you find some too long, they can be cut off and the threads cleaned up before using. Hope this helps.

From: wb8yyy_curt
Topic: 1237 Message: 1249

I suggest identifying the final audio chip (ok its a LM386), and downloading its data sheet. Very likely it will specify an output impedance. I was just looking at TI's current offering of headphone amps yesterday - and several were 16 ohms - but they vary a little).

Whether the audio amp is designed for 8, 16 or 32 ohms I sense you won't have a large difference with these headphones - but it is certainly an interesting parameter to evaluate.

Some rigs that deploy less audio gain will be more sensitive to headphone parameters (yes I found this out with the NC2030) - and perhaps you might notice that some headphones might be more sensitive with the PFR-3 especially on 20m where there is less atmospheric noise - but it may be merely you set the volume control lower (which does result in less audio distortion).

1251. Group 2 Problems

Yahoo group: pfr3_group
Date: 2010-01-25 00:46:32 UTC
From: w2lj@verizon.net
Topic: 1251 Message: 1251

I have finished Group 2 and am having problems. The receiver seems to be very deaf. The display works fine and the action of the actuators is right on the money. I can hear paddle sidetone and the tones when the actuators are pressed. I get hiss and white noise that varies as V1 is turned; but I sm not hearing anything that you would identify as, "Yep, that's 40 Meters". I do hear the 60 cycle hum when touching pins 4 & 5 of U2.

The voltages on U1 and U2 seem correct. I have rewound both L1 and T1 and am certain that I cleared the enamel off properly so as to insure a good solder connection.

Interestingly, if I touch pin 6 of U2 with a dental pick or the tips of a fine tweezers, I can faintly hear what sounds like an International Shortwave Broadcast in the headphones.

Anybody run into this? What was the fix for you? Or does anyone have any ideas?

Thanks!

Larry W2LJ

Very similiar to what I'm going through. My voltages on U1 & U2 are off a bit (see my message #1220). I'm hampered by the lack of test equipment but all the visual checks for right components, solder bridges, etc. seem to be ok. As with yours, my audio stages seem to be ok. I too, very carefully rewound L1 and T1. ?????????? John - KO0D

Is the DDS LO and BFO working? When doing the calibration checks, in the BFO trimmer set, can you hear the bfo tone? The

You can use the antenna lead to trace thru the stages, going to U1-pin1 bypasses the tuned circuit with T1 & L1. Touching U2 pin1 will bypass the crystal filter. See where noise begins to show up.

Just a few thoughts. It is a pretty straightforward receiver, just think of it as a stage at a time.

1254. Re: Group 2 Problems

Yahoo group: pfr3_group
Date: 2010-01-26 02:13:16 UTC
From: w2lj@verizon.net
Topic: 1251 Message: 1254

Lou,

Thanks for the suggestions. I went back to the Group 1 build and re-soldered some connections having to do with the DDS LO output.

Touching the antenna lead to Pin 1 of U1 is now giving me a lot more receiver noise than I was getting. T1 still seems to be a problem. I am going to rip it out once more and rewind. This time, however, I am going to use green enameled wire for the 5 turns portion. I don't know - maybe these old eyes just ain't what they used to be.

The alignment calibration that you do before you build the transmitter section, can you do this alignment after you have completed the transmitter section and put the board in the case? Do not have access to a frequency counter or scope at the moment.

1261. Group 1 Smoke Test

Yahoo group: pfr3_group
Date: 2010-02-01 19:05:46 UTC
From: michaelnarges
Topic: 1261 Message: 1261

I have completed Group 1 and all checks out. However the DDS frequency measures 11945 on my counter and I hear the signal on my separate receiver (KNWD TS 440) at the same location, as well. Thus, I know that the DDS is running, that the microprocessor is responding properly to all tactile switches, and the display is funtioning as described. The only issue is that the frequency on the DDS is not 2.115 Mhz. Any Ideas? I have double and tripple checked the Group 1 steps, finding all in order !

Thanks,

Mike Narges WF8O

> Yeah, the frequency is correct, the manual is in error. Your apparently using an earlier version of the manual, which has since been corrected, along with a few other little things which some people found confusing. The latest and most accurate manual is on the qrpkits web site.
>
> 72, Steve KD1JV
> I have completed Group 1 and all checks out. However the DDS frequency measures 11945 on my counter and I hear the signal on my separate receiver (KNWD TS 440) at the same location, as well. Thus, I know that the DDS is running, that the microprocessor is responding properly to all tactile switches, and the display is funtioning as described. The only issue is that the frequency on the DDS is not 2.115 Mhz. Any Ideas? I have double and tripple checked the Group 1 steps, finding all in order !

1264. Tuner

Yahoo group: pfr3_group
Date: 2010-02-02 13:46:26 UTC
From: k8ar
Topic: 1264 Message: 1264

I am not quite clear on the use of the tuner. I am using a Norcal doublet and can load it up fine. 1. How can I read power out with a meter on the balanced line terminals. I do have a rf to dc probe and use my multimeter and the formula of course and that works. 2. When I have the switch turned to the balanced line I still get a reading off the coax side. Am I right in assuming that both balanced and coax are rf hot all the time? Then what is the use of the switch?I am using a hamstick on 40 for the coax side. The manual states that the tuner can be used to touch up the tuning for the coaxial antenna also but I find very little if any adjustment. Thanks in advance . Ben

1265. PFR-3A Keyer

Yahoo group: pfr3_group

From: Paul Feltz
Topic: 1265 Message: 1266

I had issues with my PFR-3 and changing the key fixed it. The key had stainless steel pins that came in contact with the aluminum arms. They appeared to have a black substance in the bore of the arms and I decided it was galvanic action. I cleaned it up, added some oil and that seemed to fix it. But now that key will be swapped off. May not be an issue in another rig. I changed to a Kent Key and have had no issues. I note a difference in resistor values relative to the Key input lines from the PFR-3 to the PFR-3A. Wonder if this was due in part to the issues I had?

1271. Deaf receiver - apparently no DDS LO

Yahoo group: pfr3_group
Date: 2010-02-04 16:07:28 UTC
From: Bart
Topic: 1271 Message: 1271

Hi guys,

I couldn't check the DDS signal after Group1 due to lack of receiver/test equipment. At completion of Group2, it became apparent that the receiver is deaf, only touching U2 pin1 generates some significant receiver noise. This could indicate that U1 doesn't get any DDS LO.
Went back to the previous stage (now with a receiver available), can't hear any signal on 11.9452MHz, so I assume there's no DDS signal. The ATMEGA voltages seem to be ok though. Strange thing I noticed is that the output voltage of U10 (one of the pre-installed components), at the "+" of C35, is only 0.6v, while it's supposed to be 3.5v. Could this be a path to explore any further, or am I completely on the wrong page?

Suggestions are more than welcome...

72, Bart - ON4CCU

If only 0.6V is coming out of the 3.5V regulator (and likely getting hot) then you have a serious problem. First look for any solder whips between the leads of the DDS chip, but I think the DDS chip has gotten zapped some how. If you have short leads on your temperary power leads into the board and connected to the supply with clip leads, it can be possible to have the hot side touch one of the connections on the DDS chip and fry it. Changing out the DDS chip is possible, but not the easiest thing to do.

Steve KD1JV

1278. Question about U10

Yahoo group: pfr3_group
Date: 2010-02-07 23:58:01 UTC
From: w2lj@verizon.net
Topic: 1278 Message: 1278

Doing some troubleshooting as to why my receiver isn't working; I've come to believe there may be a problem with U10 (or a connection involving U10). I am currently not getting the 3.9V at the positive lead of C35 - only about .9V.

Now, bear with me for a second. If you look at U10, there are 4 solder connections - the "top" and then the three "bottom pins". Using my VOM to check for continuity, I get a short from the left most bottom pin to ground. I am getting a short from the right most pin to the positive lead of C35.

I am not getting a short from the middle lead to the cathode of D5, which I am assuming I should. Is the middle pin the input?

Tnx in advance,

Larry W2LJ

1279. Question about U10

Yahoo group: pfr3_group
Date: 2010-02-08 00:19:54 UTC
From: Steven Weber
Topic: 1278 Message: 1279

The center pin of U10 is indeed the input and is connected to the metal tab on the top end of the part. In the PFR-3A, power to this pin comes from the +5V regulator. In the earlier 3 model, it comes from the raw DC via D5.

Your the second one to have a problem here. I wonder if teh 50 Mhz clock chip is in upside down? If you look carefully at the silver box bewteen the regulator and the AD9834 chip, you should see a little dot near the upper left corner. If it is in the lower right corner, it is in upside down and could be pulling the regulator output low, since it sounds like its trying to forward bias a diode.

Just finished the PFR3A. Full 5 watts out on all three bands. Logged three QSO's in about 20 minutes. My sense is that on transmit and receive, this rig is about the same or better on CW as compared to my FT 817ND. Selectivity is bettter on the PFR because of the sharper filter. I am really pleased! Highly recommend this kit, but I guess that here I am preaching to the choir.

Steve,

It appears to be in upside down. The little dot by the "A" in "ASV" is at the bottom right corner. What's the recommended procedure for turning it around?

Topic: 1278 Message: 1282

Well, it can be done but is not easy.

First, wick as much solder as possible off the pins on the sides of the package. Then hold the package with needle nose pliers and apply heat to the pads on one side of it, while applying a little torque to the package. You'll have to move the iron back and forth between the pads until both of them are hot enough to get the package to start to lift off the board. Then go do the other side and repeat.

These things will take an amazing amount of heat without damage. The main problem is not lifting the pads off the board. Don't know if it will have survived being powered up backwards. You might want to test that by simply pressing the clock chip to the board without soldering to find out, as to have to remove it a second time would not be good for the board.

Now, if you had a heat gun which you can focus the air flow just on the clock chip, that would work a lot easier and quicker.

I buy all my connectors and adaptors at hamfests.

All my stuff is either homebrew or kitted so I always keep an ample supply of all kinds of spare parts.

If you're gonna be a QRPer it's a good idea to go to as many local hamfests that you can and stock up on common items like connectors, adaptors, batteries [gel cells], etc. If you don't need them now . you will!

Doug,
Thank you for the quick reply. I want to be sure I am using the correct manual. Is the PFR-3 production manual 6/10/08 Rev B the correct one?

Regards,
Bill

From: wb5qyt
Topic: 1130 Message: 1289

I'm getting 5 watts out on 30m, but on 40 and 20 only 2 watts out. I played with spacing the turns out on L8 and L12, with very little difference in output. What else should I be looking for?

Thanks, Tom

On the battery cases, pre- scrape/flux the terminals, othewise they don't want to accept solder too well. Go light with the heat.

The usual cause is an extra turn on one or more of the toroids, count them carefully. If the wire passes through the hole, it is one turn.

1293. Re: Question about U10

Yahoo group: pfr3_group
Date: 2010-02-14 02:11:33 UTC
From: w2lj@verizon.net
Topic: 1278 Message: 1293

Steve,

Thanks! I did get U11 off the board and managed to lift a pad. However, I removed some of the solder resist leading to that pad with an X-acto knife and soldered on an old capacitor lead. A primitive "pad", perhaps; but it will do.

I placed the clock chip in the right way as per your suggestion, holding it in place with some masking tape. I powered the board up; and now the voltages are correct. I get about 3.5V at the positive lead of C35 now. Unfortunately, still no receive signals when plugging in headphones; so I guess the chip did not survive being powered up "backwards" as you thought.

I sent out an e-mail to Doug requesting a new U11 chip. Thanks for your help with this so far.

1294. Tune mode

Yahoo group: pfr3_group
Date: 2010-02-14 04:55:44 UTC
From: eject12
Topic: 1294 Message: 1294

I just finished the build on my PFR-3. Everything seems to be working fine except the tune mode.

As per instructions I am holding the menu switch down however it does not sent the letter "T" It will send the letter "M" and allow me to store the message etc. I can change the keyer speed with one click of the menu switch.

What am I doing wrong?

1295. PFR 3-A is a Joy!

Yahoo group: pfr3_group
Date: 2010-02-15 15:21:09 UTC
From: michaelnarges
Topic: 1295 Message: 1295

I have had my PR3-A on the air for about a week or so. I find it to be a real fb QRP rig. My usual antenna is Par Endfedz 10-20-40, and with that antenna I have worked more than a dozen contacts both close and far. I worked North Dakota and Hawaii and many others from Florida to Texas, from Delaware to the West coast. The sensitivity and selectivity are easily on par with my FT-817 and my TS 440S. The antenna tuner allows the rig to load this antenna nicely on 30M, where it is off resonance and no longer an Efhwa. The tuner is easy to use and very useful. The paddle is probably more of a temporary item. I ordered the W5JH Baby Black Widow of the PFR. I have used my Bencher BY-1 with the internal keyer, and that too is FB. This post is not intended as a brag, but more as validation to those now building the kit that great things should be expected. Kudos to Steve and to Doug. This kit was a pleasure to build and is a bigger leasure to use.

Sincerely,

Mike Narges

From: o2jmpr
Topic: 1296 Message: 1296

Hello all,

I'm selling my unopened NIB PFR-3A kit for $225.00. I've decided not to build it and go a different route in the hobby.

I'll pay the shipping on it within the U.S. so that would save ya $20.00 and I can ship it either same day or next.

If anyone's interested, please email me at: o2jnpr@...

Thanks everyone!

Okay, I see what might be confusing you about U4, the LM386 audio amp. My cad doesn't have a LM386 symble in the libary, so I used a generic op amp and forgot to change some of the pin numbers. Pin 6 should be pin 5 for the output, pin 7 should be pin 6 for Vcc. I also forgot to add C31, which goes to pin 7, which is a by pass for better supply ripple rejection.

Thanks, Steve,
I'll look into it. After finishing the receiver section all I am getting is a high freq signal which can be increased or decreased in volume with the volume control. This is fun. Hope this old man can get it going. By the way. I threaded a needle and wound the first two torroids with it and it worked great.
Charlie,

1301. This radio is awesome

Yahoo group: pfr3_group
Date: 2010-02-19 00:53:20 UTC
From: eject12
Topic: 1301 Message: 1301

I have been on the air for about a week now with my PFR-3 and all I can say is awesome! What a neat little radio!

I purchased my kit from a ham who picked it up in Dayton last year. He had not found the time to build it. The box had never been opened. It is an early model that came with all the lettering on the case.

The only problem I have had was not being able to switch the radio to the tune mode, however I think with mine being an early production model, it did not have the tune option. I understand I can send the MEGA48 chip back to Steve for reprogramming. Hopefully that is still the case. I am in hopes I can get the thumbscrews to replace the regular ones that came with this one.

So far the only problem I have had was not realizing I have the RIT on and wondering why no one would answer my call! hi!

73,
Bill

1302. This radio is awesome

Yahoo group: pfr3_group
Date: 2010-02-19 02:37:41 UTC
From: Steven Weber
Topic: 1301 Message: 1302

All the PFR's have tune mode. Hold the menu switch down until you hear a dash (T) sound, which should be about a second after you close the switch, then release the switch. Unless your in straight key mode, then that option is bypassed, as there is no need for it in straight key mode.

Also, make sure you do the cut and jump mod on the bottom of the board to reroute the 5 volts to the proper pin on the processor, this will make the switches work more reliably.

And yes, you can still send the processor to me to be updated, which is a good idea for all who haven't done it yet and there are many of you.

1303. Re: This radio is awesome

Yahoo group: pfr3_group
Date: 2010-02-19 03:44:20 UTC
From: eject12
Topic: 1301 Message: 1303

Steve,
Thank you for the additional information. My PFR skips the tune mode. I can change keyer speed with just a press of the menu button.

If I hold the menu button down the next option I get is the memory mode or letter M. It does not send the letter T.

I have not done the cut and jump mod as it was not noted on the Production manual 6/10/08 Rev B. however I will do that now.

Is there anything else I could have missed?

I rigged up my MFJ fiberglas pole with a 20 meter inverted v attached to the top.. Bungicorded it to the awning 5 feet off the ground. When I want to operate I extend it far enough so that the ends are just off the aluminum roof. Then collapse it again when done. Yesterday made a contact in Belgium using 4 watts. He was using a 703 so less than 10 watts. Not strong of course but we did carry on a qso.I am also covering the states one by one on either 20 or 40. For 40 I have a hamstick fastened to the side of the roof with just the whip sticking up above the roof. Thanks Steve and Doug. Ben k8ar

1307. PFR-3 VS KX1 ?

Yahoo group: pfr3_group
Date: 2010-02-23 21:04:11 UTC
From: kj13227
Topic: 1307 Message: 1307

Hello all,

Considering purchasing a PFR-3. Other than price, can anyone tell me the advantages of a PFR-3 over a KX1?

Thanks, Ken, W2GIW

1308. Re: [pfr3_group] PFR-3 VS KX1 ?

Yahoo group: pfr3_group
Date: 2010-02-23 23:29:10 UTC
From: Ed - K9EW
Topic: 1307 Message: 1308

The thing I really like about the PFR-3 is that it has a 4-pole crystal filter which gives it noticeably better selectivity than the KX-1 (I have both).

1309. PFR-3 MANUAL

Yahoo group: pfr3_group
Date: 2010-02-26 01:07:51 UTC
From: kj13227
Topic: 1309 Message: 1309

Another few group questions,

I downloaded and printed out the PFR-3 6/10/08 manual which says REV B.

1. Is this the latest manual?
2. Are there any errors that need to be corrected?

Thanks, Ken W2GIW

set up buddipole antenna, pfr3 qrp radio,hf projects battery pack, headphones on frint lawn, Tuned to 20m, not much luck but, went to 40m and quickly made 2 contacts from Eastern Oregon to NW corner of WA state, and Nanaimo,BC, Canada. Not bad for a spur of the moment decision to try out set up today as weather was nice.After I finished making contacts, discovered that although I was using 40m I still had Buddipole set up for 20m !!! Was exciting anyway.
I had the Buddipole Antenna in the Horz. Dipole configuration

From: Steven Weber
Topic: 1314 Message: 1315

I guess what is confusing to some people is that I forgot to specify that after winding T1, you snip the "loop" to seperate the wires, forming the two windings. Now you have four wire ends and four holes to put them into. And of course, the lablels for these holes don't show up on the top side layout dirgram as T1 is mounted on the bottom of the board, where they are labeled.

It is simply easier to wind the 5 turn link with a continueus piece of wire instead of stoping at 40 turns, then winding another 5 turns seperately.

The other question about the 74AC02 instead of the 74HC02 - the AC is a higher speed version than the HC type and has higher output drive, so it works better, especially on 20 meters.

Steve KD1JV

1318. PFR-3A SCHEMATIC??

Yahoo group: pfr3_group
Date: 2010-03-02 00:50:58 UTC
From: kj13227
Topic: 1318 Message: 1318

Hello all,

1. Printed out the PFR-3A manual, the last page is the schematic which says PRF-3 dated 12/14/08 REV B. My question is "what happened to the PFR-3A schematic??

2. Unless I'm partially out-of-it, I don't see the "T1" toroid in this schematic!

3. Top of page 9 says "see next page for winding instructions". There is nothing on page 10 relative to "T1". Only on page 9 is it discussed....somewhat.

Ken, W2GIW

1319. PRF-3A SCHEMATIC ?

Yahoo group: pfr3_group
Date: 2010-03-02 02:02:20 UTC
From: Steven Weber
Topic: 1319 Message: 1319

Unfortunatly, you printed out the manual for the PFR-3 NOT the PFR-3A!

T1 is shown on the receiver section schematic, (next to last page) as it is a part of the receiver.

1320. Right Manual

Yahoo group: pfr3_group
Date: 2010-03-02 19:52:18 UTC
From: kb9bvn
Topic: 1320 Message: 1320

I am in the mood to buy a PFR3 kit, but I am really confused as to which manual I am supposed to use.

PFR-3_REV_B.1 manual.pdf is in the file section here
PFR-3 REV B.2 manual.pdf is also in the file section here
PFR-3A manual.pdf is also in the file section here

PFR-3A_manual_112009.pdf is on the QRPKITS website called Prosuction Manual.

PFR-3_REV_B.1 manual.pdf is on the QRPKITS website and it is called the production manual Rev B.

Which one is for a new PFR kit?

Also, my friend Larry W2LJ is building a PFR3 and his came with the U11 50 MHz Reference Oscillator soldered in upside down, this is a SMT part and I don't want to have to mess with fixing it...have all the boards with this mistake on them been removed from stock or fixed?

Thanks for the replies in advance, and I am looking forward to getting a PFR3 soon.

You are correct.

What happened is that the schematic was updated in a later revision of the manual; the one that says, "updated 12/21/09" on the cover.

The T1 deal is a formatting error. The box that contains the text you quoted should have been on page 8 and would have referred to page 9.

As far as the winding confusion, Steve answered that in message #1315.

1323. Right Manual

Yahoo group: pfr3_group
Date: 2010-03-02 22:55:13 UTC
From: Steven Weber
Topic: 1320 Message: 1323

You want to use the PFR-3A manual which is third on the list on the qrpkits web site. I've asked Doug to have the older manuals moved someplace else to eliminate this confusion, but will take a few days for that to happen. What often happens is new stuff is added to the bottom of the list instead of the top.

I've also sent him a new manual which will hopefully eliminate the "T1" confusion and which will likely be put up the same time the older manuals are moved.

Steve,

Thanks. You say use the QRPKITS manual, someone else says don't.

How about a file name, and a date stamp so I make sure I get the right one. I don't mind having to do a little digging but there are so many options for manuals and apparently they all have their own "personality" <grin>....I just don't want to waste a lot of time with the wrong document on a $225 kit.

Are you going to post your "new" manual with the T1 update to the Yahoo Group files section? If you do, would it be possible to make a folder called "OLD MANUALS" and put everything that isn't a current PDF in that folder?

Yahoo group: pfr3_group
Date: 2010-03-03 16:43:52 UTC
From: Steven Weber
Topic: 1320 Message: 1327

I can put the latest revision manual in the group files, but I can't do anything about manuals already there since they were put up by other people and only they can delete or move them. (I'll have to check to see if any were done by me, in which case I'll delete them)

As far as I can see, the manual at qrpkits has two minor errors in it.

1. It doesn't tell you to snip the loop to form 2 windings after making the 5 turn link turns, but most everyone figured that out on thier own.

2. On the MPU/TX schematic, power is shown going to the 3.5 V regulator for the DDS chip coming from the raw DC supply when if fact it comes off the 5V regulator.

And finally, one recent development, some of the recent kits were shipped with green, 0.01 ufd film caps which are about 1/2" tall and if put on the top side of the board, will keep the top of the case from mounting properly. So, if you have these caps, put them on the bottom side and lay them over, but spaced slightly above the other solder pads in the area.

And if you have a 74AC02 instead of a 74HC02, the AC is a faster type with higher output drive, so works a little better than a HC type, though both do the job.

Rich,

With U8 out of the socket, does the LED display indicate normally? Even with U8 out of socket you should be able to hear the 2.115 in your external receiver because U8 is only functional in the transmit RF signal path.

If the LED display malfunctions with U8 in the socket, it is probably shorted and pulling down the +5V regulated supply line.

Best of luck with the troubleshooting.

73.......Steve Smith WB6TNL

---------- Original Message ----------

Testing the dds chip?
the led seems to work fine.
I tune my Icom 756 Pro II to the 2.115
Hold a lead over the DDS chip and dont hear anything in any mode on the ICOM.
??

I botched the u8 install by installing the socket upside down.
Look like hell after it was all done. I installed a new socket and had a few trace issues to bridge.
I may have shorted the 74ACO2 IC. Now when I have it in the circut my group 1 assembly acts like it should. I put it back in and I just get a lite flicker on one of the zeros. Im in a holding pattern till I can get some help. Ill try to get a couple pictures. its pretty ugly.

thank you all
73 Rich Ullery NF8V Toledo.

Correction to my last: "2.115" should read "11.9452 MHz (+/- 1 kHz)" per the last line on Page 7 in the latest two manuals (12/21/09 and 03/01/10). Steve changed the injection to high-side in the PFR-3A.

OK I hear it at 11.945.2.
ZBoth with the u8 chip in and out.
I does not seem to have a problem with the led like it did.
Im going to walk away for a couple hours and see if it is still working.
I love this list.
thank you

1339. Mouser Part No. for C22/C23 (.01uf film cap.)

Yahoo group: pfr3_group
Date: 2010-03-06 14:12:22 UTC
From: w1kbx
Topic: 1339 Message: 1339

My mistake, I mounted the C22/C23 tall film caps. on top of the board and not on bottom as the manual suggested. The leads are now clipped and won't mount correctly on the bottom of board.

I am preparing a Mouser order for other parts, so will get a couple of replacements with that order.

Mouser has several choices for .01 uf film capacators. Does anyone know a good substitute Mouser Part no. for C22/C23?

Thanks,
Dan W1KBX

1340. Mouser Part No. for C22/C23 (.01uf film cap.)

From: Steven Weber
Topic: 1339 Message: 1340

You want the sub-mini type Mouser 140-PM2A103K

Of course, you might be able to tack some extra leads to the ones you have and make them work, or the leads might actually still be long enough of bent real close the the molding.

1346. Group 2 Smoke Test - Receive Problems???

Yahoo group: pfr3_group
Date: 2010-03-08 02:03:41 UTC
From: w1kbx
Topic: 1346 Message: 1346

I ran the Group 2 Smoke test and things work ok. I can hear the side tone from the keyer with plenty of volume, the Menu buttons responds and I can change frequencies with the buttons.

The problem that I am having is that the signals coming through 40m are very faint even with the volume all the way up. I connected a piece of wire to the Q2 side of R1 and adjusted C1/C2 for maximum noise. I left the screws on the back side of C1/C2 in the factory settings.

Any ideas what could be wrong?

Dan W1KBX

Hi Dan,

Many times the rx will suffer, if the leads from L8 and L9 are not tinned well. Or if the leads of T1 happen to not be correct, the rx will suffer on all bands... common problem with T1 is the leads hop into the wrong spots on the board.

Good luck, it's worth it,

From: Steven Weber
Topic: 1364 Message: 1366

Well, the exact number of turns on T1 and L1 are not especially critical, being off a couple of turns too few or too many isn't going to make a noticable difference there.

However, you DO need to make sure you have the specified number of turns on the Low Pass Filter coils, but those use less turns so easier to count and keep track of.

Steve,

I replaced the upside down clock oscillator chip, with a new one that
Dan Tayloe had sent. Voltages are now correct; but still no receive.
Do you think anything else could have gotten damaged by U11 having been
installed backwards at the "factory"?

What worked for me for the high count turns was to stop at half the count, check the number of turns actually made and if correct squeeze the turns close together and place a small tape on the completed turns as a marker. Then finish the winding. When done, I checked the two halves for count. For more turns I probably would break into thirds.

1374. PFR3 Firmware

Yahoo group: pfr3_group
Date: 2010-03-15 12:36:36 UTC
From: esteve_ll2000
Topic: 1374 Message: 1374

Hello,

I do not usually write in the group but always looking the group and photos.

I really enjoy my outdoor activities with the PFR3 but can see a few things with the firmware.

Sometimes when want to go up or down in the band the display change info and put other band then back to the right one.

Also with the keyer memory sometimes bad transmision of characters.

Yesterday the paddle do not want to transmit.

This are minor errors but like to know if there is a new firmware version for this nice radio.

I upload a few photos of my last sunday activity from the beach in the photos area.

Thanks,

72, Esteve EB3EPR

From: OK1DDQ
Topic: 1374 Message: 1375

Hello,

I have similar experience like Esteve. I have PFR3 (not PFR3A) and when temperature falls below zero, The VFO don't start and display stay blank on position band switch 40 and 30m. I have to switch it to 20 m and then starts VFO and display and now I can come back to 40 m, PFR3 works well. Sometimes in lower temperatures is temporally CW broken.

Thank for you answer.

1376. firmware

Yahoo group: pfr3_group
Date: 2010-03-15 13:53:29 UTC
From: k8ar
Topic: 1376 Message: 1376

I noticed the same thing. Sometimes, not always, when I send a programmed cq it will mess up with one or two character in the message. Also at least when I am on twenty the display will suddenly change to 40 then back to 20 all in the space of 1 or 2 seconds. Doesn't really bother but there does seem to be a glitch there somewhere. Ben k8ar

1377. PFR3 Firmware

Yahoo group: pfr3_group
Date: 2010-03-15 15:27:51 UTC
From: Steven Weber
Topic: 1374 Message: 1377

There is a firmware update which will fix the occasional glitch in the message sending. A timer interupt can occasionally happen when the next Morse word to be send is being fetched from memory and becomes corupted.

The other problem with it suddenly changing bands when tuning is usually solved by doing a modificiation to the circuit board. The track connecting +5 volts to pin 21 needs to be cut and the 5V moved to pin 20. On the PFR-3A, this pin is connected correctly.

I do not know why the paddle input would stop working. That should never happen.

Hi
I'm up to the # 2 smoke test. I don't have a scope I only have a ATH 30 freq counter. I read the instructions on line for the ATH.
I tried to do the BFO via the calibration. About went deaf.
I tune on my 756 pro turned it down to 5 watts sent some cw.
I have 40 meter Sig's all over the band. I can hear my cw through the pro but I only have receiver hiss and cant hear any other Sig's on the band.
Any ideas would be greatly appreciated.

1389. AGC action

Yahoo group: pfr3_group
Date: 2010-03-26 15:18:53 UTC
From: psmudgett@verizon.net
Topic: 1389 Message: 1389

Just finished getting my PFR-3A together. Wow! am I impressed with the nice design, cabinet, and overall kit and performance! My first PCB assembly.

I wonder if AGC is working. For all stations stronger than perhaps S7, I have to detune the RX Peak (a lot) else I get annoying clicks on the tail of the received dots and dashes. Looking at the schematic I see C81 as possibly AGC coupling, but I don't see C81 anywhere in the text or on the PCB.

On another matter, I notice minor descrepancy on schematic vs PCB regarding switches S5 - S9. Note that the power sw is not numbered in text or PCB.

Thanks guys, and 73

1391. AGC action

Yahoo group: pfr3_group
Date: 2010-03-27 17:14:12 UTC
From: Steven Weber
Topic: 1389 Message: 1391

That is the unfortunate side effect of audio derived AGC. It takes a few cycles for it to respond, so those come out full volume and result in the thump. The AGC hang time is a compermise between it holding for a reasonable time, but not so long it delays the QSK swtiching time. So, for strong stations with slow code speed, it will decay enough that it has to start up again at the begining of each word group.

The main reason its in there is to help protect your ears if you have the volume turned up and tune across a strong station.

Rich,

I bought an old Tek 465B a few years back and it has served me well.
I think it's a 60Mhz scope, dual trace. I've seen these in the price
range of $75 to $150 or so at a lot of hamfests. New probes will run
you about another $35 or so. This is an OLD model...late 1970's
maybe.

I would suggest you not buy anything slower than 60 Mhz...try to find
something at least 100Mhz.

Hi
On the first part of the pretest I get 12 volts on 74AC02 (formerly 74HC02). I get 12 volts by all pins except pin 8, It is 11.5 volts??
Is that normal?

Below paragrafs 4 and 5 what am I doing to bring the voltage 12 V to 2.5?

Rich NF8V

Please read the following in the manual on page 11.

Pretests:
Before installing L7, we need to make a few tests first.
☐☐ Install U8, 74HC02
☐☐ Put rig in straight key mode by applying power with dash paddle closed or use straight key. If using paddle, dot paddle will now key the transmitter.
☐☐ Measure the voltage (to ground) on pins 1 and 13 of U8. They should read 0 volts.
☐☐ Key the transmitter and measure the voltage (to ground) on the L7 pad to the right, next to C57. The voltage should be about the same as the supply voltage to the board. If not, check the connections and proper values of R34 and R35. Also check Q5.
☐☐ With the transmitter keyed, check the voltage on pins 1 and 13 of U8 again. These should now read about 2.5 volts. Since these pins now have a square wave at the transmitter frequency on them, exactly how a DVM responds to this signal may depend on the particular DVM used.
☐☐ If all these tests are OK, it is now safe to install L7.

Hello Rich.

I live in Toledo and successfully built one of the first PFR3s. I'd be glad to try to help you out.

Please contact me off the list at: jafeustle@...

If your measuring 12 volts on all the AC02 pins, something is seriously wrong! There should be no more than 5 volts on any of the pins and pin 7 should be at ground, along with several others, I'd have to look up the schematic to see exactly which ones these are. If every thing else is working okay - the display works, ect, then the supply voltage must be okay and you are not using the volt meter correctly or it is not reading correctly.

KD1JV
Hi
On the first part of the pretest I get 12 volts on 74AC02 (formerly 74HC02). I get 12 volts by all pins except pin 8, It is 11.5 volts??
Is that normal?

Below paragrafs 4 and 5 what am I doing to bring the voltage 12 V to 2.5?

Rich NF8V

Please read the following in the manual on page 11.

1404. QRP Kits Customer Service

Greetings all,

Just a reminder that Hendricks QRP Kits changes their email addresses several months ago and if you try and send email to the old addresses they will not be bounced back.

On www.qrpkits.com on the main page there is a section on Contact Information for QRP Kits. It has the email addresses for general questions and another for parts.

Hi Steve
everything else is working fine, eccept the reciever, can hardly hear anything. will re-do T1

Going back to the manual Ill address what I did below.

Pretests:
Before installing L7, we need to make a few tests first.
☐☐ Install U8, 74HC02
Iv Done that.

☐☐ Put rig in straight key mode by applying power with dash paddle closed or use straight key. If using paddle, dot paddle will now key the transmitter.
Iv done that.

☐☐ Measure the voltage (to ground) on pins 1 and 13 of U8. They should read 0 volts.
Done and checks ok. 0 volts

☐☐ Key the transmitter and measure the voltage (to ground) on the L7 pad to the right, next to C57.
The voltage should be about the same as the supply voltage to the board. If not, check the connections and proper values of R34 and R35. Also check Q5.

Done. I am keying the xmiter using a 12 volt power supply the instructions say "The voltage should be about the same as the supply voltage to the board." it is.

But Im lost below. What do I do or change to drop the voltage from the supply voltage 12 v down to 2.5 ???? Im sorry, im being dense about this.
Rich NF8V

☐☐ With the transmitter keyed, check the voltage on pins 1 and 13 of U8 again. These should now read about 2.5 volts. Since these pins now have a square wave at the transmitter frequency on them, exactly how a DVM responds to this signal may depend on the particular DVM used.
☐☐ If all these tests are OK, it is now safe to install L7.

Rich NF8V

You don't have to do anything but key the transmitter. There are two indepenent circuits here. The first step tests the keying of the supply voltage to the drains of the PA FETs. The second test tests the output of the logic gates driving the gates of the PA. The 74AC02 is powered from the 5 volt regulator, not directly from the raw 12 volt supply. Take a look at the schematic.

The voltage on pins 1 and 13 should be 0V when in receive and 2.5 volts in transmit. Those pins measure 2.5 volts because they are now clocking at the transmit frequency and the average voltage is 1/2 the chip supply voltage of 5 volts, or 2.5 volts. However, depending on the kind of meter you have, it might not respond well to the RF voltage on pins 1 and 13. The important thing here is that the voltage is 0 during receive and not a steady 5V during transmit.

I also have an original PFR-3. I can successfully program the memories (just follow the manual, it does usually take me a couple of attempts), but the keyer will randomly mess up (send gibberish). I've just given up on using it because of the annoyance. I reported it/asked about it shortly after I built it and received no response, however I suspect it is a firmware flaw.

Would have been nice if the keyer did work last year for FOBB, but I resulted to just sending my CQ's manually because I had little confidence in it's performance.

Hi - I also have a 4/09 PFR3 with memory keyer problems - difficulty entering text and uneven playback. There is no magic fix, it is a problem with the keyer chip; I emailed Steve a few weeks ago and he said he would send me an upgraded chip and I would send back the original for re-cycling... it has not appeared yet- I am being patient since this is his "side job". MEANWHILE: here is what I am doing for the ARCI Spring QRP contest; I set the unit in "straight key" mode (by plugging in the paddle and keying a DAH as I turn it on)- I then plug in my trusty K1el WinKeyer and use it in standalone mode with the CQ and contest exchange in memories.... you lose the RIT and other menu functions, but it works...

Even with the rigs quirks, I love the PFR: I have over 50 Qs so far in the ARCI contest - even with LOUSY condx... the sharp tuning is an asset with all the qrpers jammed tween 14.059 and 14.063-

Hey: eat your choclate bunnies and get on the air! - this is one of the best qrp events of the year...and it ends at 2359Z, today...

1412. Power save mode

Yahoo group: pfr3_group
Date: 2010-04-05 11:33:21 UTC
From: w0ese
Topic: 1412 Message: 1412

I built my PFR-3 in May of 2009 from the revision B.2 manual. The manual states that after 5 minutes of no switch activity the rig will go to power save mode. According to the manual, it will only "wake up" if any switch except the band or paddle is used. My rig will "wake up" if I use any switch, including the band switch or if I key the paddle. Would be nice if the rig remained in power save mode during a rag chew, etc. to save a little battery.

Just wondering if the manual is incorrect or if my rig is behaving this way due to its firmware.

Yes this feature only impacts the frequency display and rig use brings it back alive. Sounds like you would like the display to literall have an on and off switch ... perhaps study the schematic to see if you can easily implement this - I suspect you can add a switch to turn off power to the display itself. Is it worth the trouble ? I think Steve has already related the mA for the receiver and the display in the manual.

It could be indeed the manual is incorrect on this, as I think my display comes back when I use the paddle.

Steve has openly admitted the issue, I think even in the manual. I suspect it is a limitation within the controller hardware resources - and Steve certainly optimized it as much as possible.

Yes the secret is to pause a bit between characters. It is hard to do, but it will work. Just pause a little longer between words.

I always forget how to use this keyer, versus the others I own - so I keep an index card with the rig.

I can imagine this is the main firmware upgrade one would want, but I suspect it also requires a hardware upgrade.

For a serious contest effort, an external keyer may be appropriate. I do have my call successfully programmed into a memory - which for my call is a significant accomplishment.

Meanwhile enjoy the nice rig -- I enjoy mine with Jerry's custom paddle attached to it.

Brian

the PFR-3 has a pretty decent xtal filter. i vaguely remember measuring the response of mine with spectrogram. if you can do this it might be useful to compare results. note the xtals are same parts as the K2, but in this case fixed capacitors are used in between them. you could also compare your PFR-3 response to other 'simple' QRP rigs you have with xtal filters.

I use a NESCAF some on 80 and 160m to reduce QRN for low band DX'ing - but generally I find xtal filters to be sufficient. If you really want to try something for narrower filtering, a NESCAF is inexpensive compared to most outboard DSPs - and a decent approximation for basic filtering.

I borrowed a SCAF from W9ILF today and will play with it for a week or so.

During the sprint last night, the stations were pretty close to each other...I think the filtering in my Norcal 40A is somewhat better.

I don't have a copy of Spectrogram, and I believe it has become unobtainium...am I right on that? If it is Freeware, could I talk you into emailing me a copy? If it is not Freeware, then nevermind.

I still like the PFR-3 and I hope I can use it from my car at lunch while connected to a variety of Hamstick type antennas. I need to make the PCB modification to see if I can get the keyer memory to work right. I think I have determined this PFR-3 I have is one of the original 100 or so, so I need to dig in the group and see what other mods I might need to do.

I need to get a smaller set of paddles for the car, my Vibrokeyer is a bit bulky.

1424. keyer memory

Yahoo group: pfr3_group
Date: 2010-04-23 23:15:37 UTC
From: psmudgett@verizon.net
Topic: 1424 Message: 1424

Got my PFR-3A in early December 2009. Generally very happy with it. Saved keyer messages a problem. For example, a 22 character, 7 word message screws up about 1 char (or space) on average each time sent. The location of screw up is random (or semi random) and shows as a reduction in time for the programmed element. For example, an "A" will transmit as "II", or "CQ CQ" will transmit as "CQCQ" or "K" as a short dah and "A". This is NOT a problem with recording a bad message, it is (semi) random error, that is, I notice some places in the message are more prone to error than others. Any ideas?

For the 3 or 3A - thier not interchangable, so I need to know which one.
Steve

Would you please send me a new keyer memory chip?
I'll send the old one back to you in return.

Thanks, Tom Wb5qyt

1436. Battery life

Yahoo group: pfr3_group
Date: 2010-04-28 20:19:15 UTC
From: k6mgo@verizon.net
Topic: 1436 Message: 1436

Hi, thinking of building the PFR-3 and was wondering what kind of batteries is the most popular, and what kind of life are you guys getting out of them.
I tried to look this up in the Database, but, when I go there, I can't enter anything into the table, or find anything.
So, what size AA's are most popular, and how long do they last, on average, between charges, and/or do most use external gel cell batteries?
Also, are you bothered by the voltage drop in the battery holder itself?

Tnx for any help,

73,Bill, k6mgo

Topic: 1436 Message: 1437

Hi Bill, I tested normal AA unchargeable batteries 1.5 V. It last for about 1 hour of the work for power 5 W, NiMh batteries 1.2 V last long time, but max. power is 3 W. I have best experience with LiPo batteries. I inserted 3-cell LIPo battery 2.2 Ah instead of battery holder 8 x AA. Working range of the 3-cell battery is 11 to 12.6 V and power is about 5 W, working time is about 8 hours.

1440. PFR3 Manual Question

Yahoo group: pfr3_group
Date: 2010-04-30 03:16:52 UTC
From: joey
Topic: 1440 Message: 1440

Hello all!!

I purchased a PFR3 kit a couple of years or so ago. I started building it but then my wife gave birth to our son and I have struggled to find time to finish the build. It's in the back of my mind that I need to finish this thing. So I decided to look at the manual and the board that I started building in order to figure out where I left off. It turns out I just finished Group 2.

I pulled out the manual and thumbed through it and then I decided to go to the qrpkits.com website and see how much the newer version of the manual differs from the one I printed out way back when I bought the kit.

I see that there are a few modifications that are shown in the newer version of the manual. Now this may seem like a dumb question so please forgive me. Should all of these mods, which are shown in the newer manual, be done to my older kit as well?

Regards,

Joseph

1441. PFR3 Manual Question

Yahoo group: pfr3_group
Date: 2010-04-30 20:08:04 UTC
From: Steven Weber
Topic: 1440 Message: 1441

If you have the original PFR-3 and not the A, then the only mod you have to do is the power supply cut and jump at the processor to put the 5V on the correct pin for the A/D converter. The mods for the A version do not apply to the 3. (or visa versa)

1442. Band Changing on its Own

Yahoo group: pfr3_group
Date: 2010-05-01 01:23:18 UTC
From: Bill
Topic: 1442 Message: 1442

Ever since I've completed my PFR-3, while operating, it will occasionally change to the 30 meter band. Usually, it will flip back to the correct band after a second or two, but on a few occasions, it has stayed on 30 meters for several minutes, regardless of the band switch settings. I checked the connections and resistance values in the circuit that controls the voltage on pin 24 of U6 and can't find anything wrong. It happens on both 40 and 20 meters (actually, it happens on 30 meters as well, sometimes on 30, the frequency display will be replaced by "30" for a second like it just changed bands.

Has anyone else had this problem or have an idea what could be causing it? It's been really frustrating trying to troubleshoot because whenever I take it apart and put it on the bench, it won't happen for hours. Conversely, whenever I call what would be a new QRP country on 20 or 40, it seems to happen almost instantly.

Bill, KF8GE/HL9TY

1443. frequency changes

Yahoo group: pfr3_group
Date: 2010-05-01 11:35:43 UTC
From: k8ar
Topic: 1443 Message: 1443

I have noticed that with my pfr3-a also. It has always been a temporary thing taking only a second or two and then it reverts to the frequency I was on before. I have noticed that it is better to switch the unit off before changing bands. Not doing that SOMETIMES it will not transmit after changing bands. All seems normal unless you have a meter in line and see that there is no output. Ben k8ar

Hi Dale,

Yes, I have seen the ones on the RS web site but they are taller and narrower which is OK, but they use a smaller mounting hole than the ones used on the SLT+. I am not ready to resort to covering the holes with a plate and drilling for smaller diameter posts. I like the look of the stubby posts.

Doug sent a note out today that he has shut down QRPkits until after FDIM/Dayton. He will resume shipping orders on May 24th according to his email.

Maybe you can meet him at the FDIM vendor night and get a new set of stubby posts?

Similar experience here. I received my PFR-3 kit earlier this week and have just started going over the parts list. Less than halfway through, I have already discovered that 14 resistors are missing. Hope to catch up with the vendor in Dayton - I am sure things were just left out in the packing rush. This is my first purchase from qrpkits, so I am hoping they stand behind the product.

Dean,
Thanks for your help. I should clarify that my unanswered email to Doug was a minor shipping question, not about missing parts - and I used a different address, so that was my fault. I will ask about the missing components via the one you suggested.
I am excited about building the kit and using it "in the field."

I have had problems getting replies as well. I think Doug has alot on his plate. Iv even argued with him. I can say from experience in the end he will come through. He's an OK guy. Just remember he and Steve Webber are 2 of the few selling and developing kits of quality. Treat them gently. Its not like fast food get mad at the golden arches so go to Burger King.
Just my thoughts, Rich NF8V

Less than halfway through, I have already discovered that 14 resistors are missing. Hope to catch up with the vendor in Dayton - I am sure things were just left out in the packing rush. This is my first purchase from qrpkits, so I am hoping they stand behind the product.

From: Doug Jackson
Topic: 1445 Message: 1459

Hi Everybody,

I have a couple of small thing to add.

One person mentioned that 11 of the resistors were incorrect (or missing) - I recently built a PFR3A and was having enormous trouble - till I discovered that I was using the PFR3 manual, not the PFR3A manual. (Can't believe I did that...) - I had to keep going to the parts draws for components.... In the end, I got the right manual down, and had no further problems. I am not saying that you have the wrong manual - that is just my personal experience.

Also, I know that kit makers can get surprised (and even overwhelmed) at times. I have started selling a project for a simple word clock (www.dougswordclock.com), and things can go at one kit per month, and instantly drown me at 15 kits a month. Boy do the stress levels rise when it gets busy, especially as I have a day job! One thing that is for sure, the PFR3 kits certainly did helo me improve the quality of my own kit, and I have learnt a lot.

Anyway, the PFR3 is a great little radio, which is beautifully designed and executed.

Thanks for an awesome kit.

We Radio Amateur's are a small retail market. Its nice when people try to feed our need, even out of a garage. I can tell you Doug will never get rich selling kits. I was just trying to encourage you to hang in there and the wait would be worth it.
I wont make that mistake again.
Rich
P.S.
For me radio is a hobby, I placed you in my spam bucket, I have no reason to argue about it.

Rich,

Doug may have a lot on his plate but part of doing business is taking care of your customers. Having to ring his bell a dozen times to get parts is nonsense. If that's the case, then he needs to get help who can. There can't be THAT many requests. Steve takes good care of his immediate customers. BTW - there are other quality builders and clubs supplying good kits, maybe not in the number of kits that Doug does but others are available. Steve

I agree: I had a very nice email interaction with Doug, and he is more than happy to send the parts. I am new to this group and somewhat of a newbie to the hobby, but am really impressed with the simple, robust construction of PFR-3A.

Have any of you done some backpacking with the rig? If so, has the internal battery pack been suitable or is an external battery suggested? I tend to be a "long weekend" backpacker when time allows, so my needs might only amount to a few hours in a trip. Any recommendations are appreciated.

Just a heads up that the replacement IC for my PFR-3 keyer arrived yesterday. I popped it into the socket and the keyer works as it should - without a hitch. A public thank-you to Steve for his help. When you get YOUR replacement, be sure to send the old one back to Steve asap; this is probably one of the reasons that replacements are slow: folks are not sending their old ones back to be reprogrammed... I worked RA0AA through a pile up right after the swap out... the little yellow guy ROCKS!

I haven't done any overnight backpacking trips with the PFR-3, but I have done several day trips using the same set of batteries with no problems. For a long weekend backpacking, you can probably get by with the internal batteries and one set of spares.

Thanks to all for the input. I am curious about a lithium battery. I looked on the web and at the local Battery Warehouse and most of the Li batteries I came across were 3.6 V or not rechargeable. I am probably searching incorrectly.
Dennis, the one you mentioned in your message sounds perfect, especially if I can . Can you tell me the vendor or provide a link?

If you do a search on Ebay for Lithium battery 12VDC, you will get many hits. The batteries I looked at included chargers which must be different from other rechargeable batteries. Most of the vendors are in China and Singapore.

Wonder if you noticed if your new chip had 1 or 2 'dots' on it (I think that indicates the version)?

I also wonder if you have tried the Straight Key mode? I got an updated chip some time ago and the SK Mode doesn't work correctly and I think that it did before. When I start it in SK mode and hit that key it never comes back to RX.

Thanks - 73

From: jparnell@igc.org
Topic: 1464 Message: 1470

I did not note the number of dots on the new keyer chip, I just eagerly popped it in and put it back together. I had some "problems" until I carefully read the manual: the rig would not go to RX after programming the keyer...I re-read the instructions and noted that *I needed to hit a dit or dah to chose memory #1 or #2* - Mine worked in straight key mode in that I was able to turn it on while hitting the "DAH" paddle and key it for adjusting the internal ant tuner using SWR light - my only problem with RX mode is when I forget to flick the tuner switch back to OPER... I dont remember if it worked in RX immediately afterwards, it seems like I would have noticed if it didn't...I am at work now, but when I get home, I will try straight key mode with a key AND my keyer (I sometimes use my Wnkeyer/software with the PFR during contests to send sequential serial numbers.) I will let you know if I note any squirreliness...

Topic: 1464 Message: 1471

OK, I am back home in the shack and have tested my PFR-3 (the "old" rig, NOT the 3a) with the new keyer chip in straight key mode: my RX works the same as it does in keyer mode. I tried it with a straight key AND an external keyer and it works FB on TX and RX.... no problems at this end. The only thing I could think of that could cause an RX problem would spacing out switching back to OPER position from TUNE after using the ant tuner in the SK mode. I would assume that this is not your issue.(I admit to making this mistake once in a while!) I would toss this back to the group and see if any one else has experienced this problem or might have a better clue.

I have a PFR-3 radio for sale, it is one of the ones with the painted on lettering instead of the decals, in good working order, and was built by Lou W0TQ.

Three bands, built in BLT tuner, excellent audio, new keyer chip from Steve KD1JV.

Asking $210.00 shipped to the US. I will sell DX if the buyer is willing to pay the full shipping costs.

From: KB9BVN
Topic: 1473 Message: 1477

Nick,

I will install the chip and send the manual. The manual version I have is for the PFR-3A dated 03/1/2010 and as far as I know it has the latest updates in it from Steve KD1JV.

If you look on the PFR-3 Yahoo group files section you will see a couple of different versions of the PFR-3 manual. I'd suggest you get them all and print them for reference material in the event you would ever need to refer to them.

Thanks

Brian,

I would appreciate it if you could install the chip. Also do you have the manual?

I will send you a check Monday morning.

I look forward to working you on the air with the PFR-3.

Nick,

Please mail payment to:

Brian Murrey
47 Grassy Drive
New Whiteland IN 46184

Postal MO gets instant shipping, personal check I will wait a few days before shipping.

I have the brand new keyer dhip from Steve KD1JV, and I have not installed it yet. It is supposed to fix a bug in the old chip, I never used the keyer memories anyway so it din't really cause me any trouble. Do you want me to send the new chip with the radio, or would

you rather I install it before sending it to you?

1483. NEScaf filter as an AMP

Yahoo group: pfr3_group
Date: 2010-05-23 02:53:21 UTC
From: orangelite
Topic: 1483 Message: 1483

I just built a great little audio filter, "the NEScaf" kitted by the NE QRP club

http://newenglandqrp.org/nescaf

- the main reason I built it was to give some better cw selectivity to my old Argonaut 509 and my SWL Rockmite20.

Just for laughs, I tried it on my PFR-3: I was astounded by the fact that it is also a great audio amplifier! The NEScaf has an adjustable audio pot on the board to compensate for the filter's insertion loss, you can tweak a bit more and it really gives the PFR audio some punch: I have it so it drives my old Motorola speaker almost TOO loud at full CW. Since the PFR tuning is so narrow, you rarely need the filtering (in a contest maybe), but it sure does the job. I was able to cram the filter into a very small Mouser enclosure. If I was to do it again, I would mount an vol. adjust pot on the panel to make it easier to move from rig to rig. An elegant solution for the low audio "problem", and good tool to have around the shack- (and it's only $31!)

72 de k7hv (who just worked RV3FF with Mr. Yellow!)

1484. Re: NEScaf filter as an AMP

Yahoo group: pfr3_group

From: n1rx
Topic: 1483 Message: 1484

Hi John.
Glad to hear that the NEScaf is working well for you. Yes, it was designed to have plenty of gain. The idea was to be able use the volume control on your rig, and just set the internal trimmer to match levels with the filter in and out. The result is plenty of extra gain.

Just wanted to let people know that we are running low on kits, and will be pausing briefly for rekitting. An issue these days is that many parts suppliers are keeping their inventories rather trim. This means back-orders are common. We are waiting on some capacitors and knobs for the next round. We expect to have a comfortable stock of kits again soon.

72/73 de Bruce, N1RX

1486. Feld Hell

Yahoo group: pfr3_group
Date: 2010-05-27 02:50:37 UTC
From: k9jri@att.net
Topic: 1486 Message: 1486

Is anyone aware of any QRP Feld Hell (Hellschreiber) activity using any of the popular QRP CW radios. It seems to me that any of the Feld Hell programs (like cocoaModem or fldigi) could drive a tone to on/off open collector CW keying circuit that would key the CW transmitter.

I don't see any real technical issues here but I am curious if this mode is being used by QRP operators and, if so, on which bands and frequencies?

I can not find anything on the AT3b1. I believe the PFR3 and the NADC-40 (both on order) will work well on Feld Hell with a keyer. I have the circuit that should be more than fast enough for Feld Hell keying speeds. It is a circuit that W7AY recommended a few years ago. It was intended to convert CW audio output from a multimode program to on/off CW for a CW transmitter.

From: George Silver
Topic: 1493 Message: 1493

Rich NF8V.

The substitution of a COG type capacitor with a Ceramic depends on what it is used for. If the COG type is used in the clock circuit, or crystal circuit it was selected specifically because it has a very low capacitance change with thermal changes. Usually used in places that require a stable capacitor to achieve a stable reference or frequency or waveform performance.

See the description docs at the vendors selling those capacitors for the sensitivity..

I need 1, I find low profiles on ebay
6 pcs. 3.579545 MHz 3.579545MHz Crystal HC-49/S
6 pcs. 20.000 MHz 20 MHz Crystal HC-49/S Low Profile
2 pcs. 10.000 MHz 10 MHz Crystal HC-49/S Low Profile

I the pfr manual I only need one. I am moving all my parts to another board (I botched the first one). I was trimming solder with a dremel and a separating disk.... arrgggg... I slipped and punched a hole into it.

I also need a 2.2 uhy RFC (red red gold gold) (one as well).

I cant seem to find a source on the net, I don't want to make Steves job any harder filling orders.
So Im trying to buy the 2 items I need.
can anyone help point me to a vendor or can I buy some overstock anywhere?
thank you in advance.

Rich,

Man, DITCH THE DREMEL TOOL for this project!! Don't get that thing anywhere near your PC board!!!

If you can't afford a pair of flush-cutters, wait until you can before you proceed!!

Now although that is good advice. It did not awnser the question.

I was trying to grind off the solder w/o over heating the xtal.
I used a solder sucker on the pins of the xtal. I was trying separate the can from the board, it worked on 2 others.

lesson learned, I would not do it again.

Rich,

Yes, I apologize for not trying to help you solve the immediate problem but use of a Dremel Tool to remove components shocked me and I didn't quite understand what you were saying about the crystal in your first email.

Anyway, none of the crystals in your list match what you want. The crystal you're looking for is a 4.9152 MHz in an HC-49US holder (it says 'HU-49US' in the manual but I'm fairly certain that's a typo). The problem is that there are other spec's. you need to know so that the replacement crystal matches the good ones you removed and those aren't stated in the manual.

Maybe someone in the Group knows more about the crystals in the PFR than I do and can give you some guidance but my recommendation would be to ask Steve. Also, that crystal will be relatively inexpensive so I'd recommend replacing all 5 just in case you croaked one or more of the others during removal (you can't always determine the crystal's condition by its outside appearance).

As far as the 2.2uH inductor goes, that's fairly well a 'garden variety' part and can be obtained from most any parts vendor.

I'll look in my parts stash and send you one if I have it.

73......Steve Smith WB6TNL

Thank you Steve. I spent 20 years as a jeweler, Sometimes I
go into Goldsmith mode and problem solve a little differently.
No need to apologize, in the past you have answered questions
for me.... A True Amateur from the old days I appreciate your comments
I'm 48 now my eyes are not very good anymore. When I was 17 on, I built quite a few Heathkits. my first call was KA7TZW (Novice). I cant work right now and I wanted to start building again for something to do. Kits as in Jewelry I like working with small things, I have found im not as sharp at building like when I was 17 through my 20's. It disappoints me,
73
Rich NF8V

PS if you do find a 2.2uH inductor I will gladly pay you for it.

1505. pfr3 unit for sales

Yahoo group: pfr3_group
Date: 2010-06-05 17:03:51 UTC
From: n5drb
Topic: 1505 Message: 1505

Hello all,

I'm cleaning out my shack and I have for sale a fully built PFR 3 unit with the paddles.

I'm asking $225 plus shipping.

I will be glad to send pictures of the unit.
just drop me an E-mail to dburton@...

Dennis, n5drb

1506. PFR-3A Arrived Today

Yahoo group: pfr3_group
Date: 2010-06-09 21:30:02 UTC
From: k9jri@att.net
Topic: 1506 Message: 1506

I just finished the NADC-40 this morning and the PFR-3A was in the afternoon mail. This is my last kit for a while having already built the BitX20A and the NADC-40 in the last two months.

I hope this kit works as well as the other two. They both worked first time although I did have a bit of trouble with the first digital dial. All my own problems though :)

need for my PFR-3A one 2.2 uhy RFC 5% (Red Red Gold Gold)

Does any body have a spare laying around I could buy?

Or a source where I can buy a small package?

Iv googled it, all I find there are SMD's, I have digikeyed it and it comes up with no maches.

thanks for looking.
Rich NF8V

Today was a great day to go to the shooting range so I did not start any building. I did place the decals though and that took about 1.5 hours. They look pretty good though and will be ready for the Krylon Matte spray tomorrow morning.

More progress reports will follow :)

All is going well thus far. The paddle works well and all of the receiver and transmitter pre tests were passed with flying colors. I am now on page 12 where the lo pass filter coils are wound and installed. Only about 8 components left to mount other than the coils/transformers.

Very nice kit!

Topic: 1506 Message: 1517

Well the PFR-3A is built but not 100%. I believe I either reversed a winding on T2 or mixed up the primary and secondary wires on one end. The SWR LED is always bright which makes me think I transposed a primary and secondary wire on one end.

Power is a bit low on 30M. Only 2.5 watts on 30 but good on 20M & 40M. My guess is an extra turn on either L10 or L11. That won't be too hard to check out. Everything else seems perfect but I won't know for sure until I get the SWR bridge working correctly so that I can check out the BLT.

The receiver is really sharp. Noticeably narrower bandwidth than the NADC-40.

I will let you know what I screwed up :)

1518. PFR3A- Group 1 Smoke test problem with DDS chip??

Yahoo group: pfr3_group
Date: 2010-06-13 12:30:03 UTC
From: bobpaiva@ymail.com
Topic: 1518 Message: 1518

I have just started building my PFR3A and did the first smoke checks. All was well till I tried doing the last check, "General coverage reciever tuned about 11.9452 Mhz(+/- 1 khz)with a short pickup lead for an antenna placed near the DDS chip (U6)"

There was some noise on the freq before I started. I used a short piece of coax (1 foot) with a 12" alligator lead.
I checked all of my solder joints, not a problem that I can see.

Should the result of the test be a very strong sound or soft?
Does it sound like something went really wrong?

This newbie to CW would appreciate all comments or suggestions.

With the alligator clip lead...laying on U6, the other end of the lead to the center of the coax connected to your receiver, the signal should be very noticable, an S 4 or more. With that short antenna, the background noise in the rx should be very minimal, S-zero. You may need to tune your rx a little one way or the other to find it. Lay the lead across U6, to minimize body pickup, turn the lead loose, but insure it doesn't jump back onto the PRF3, shorting something would not be a good thing.

Good Luck,

1520. Group 2 smoke test : low receive sensitivity

Yahoo group: pfr3_group
Date: 2010-06-13 14:50:16 UTC
From: Jacques
Topic: 1520 Message: 1520

Hi Group,

Jake, ON4YZ here. I started assembling the PFR-3 yesterday and Group 1 smoke test was ok.

Now I'm in Group2 smoke test and I'm not happy with the performance of the receiver. Though lot of users say how wonderful the PFR-3 is. And I believe them. I must have do something wrong. I made T1 according to the description. When I pick the antenna on the hot point of C2 the signal is much stronger.

Voltages mesured with DVM
Voltage regulator U5 is 78L05 : in=12.04, out=5.05
U10 :in=5.05, out=3.30

U1,U2 SA612:
P1=1.38, P2=1.38, P3=0, P4=3.86, P5=3.88, P6=4.92, P7=4.38, P8=5.05

U3 LM358:
P1=4.62, P2=4.64, P3=3.15, P4=0, P5=4.62, P6=4.62, P7= 4.61, P8=12.04

U4 LM386
P1=1.37,P2=P3=P4=0, P5=5.89, P6=12.02, P7=5.92, P8=1.37

Any help would be very much appreciate.

Hi Mike,

Thanks for your comment. Issue with T1 is what I suspect too, because C1/C2 doesn't really peak. I have unsoldered and re-inspected it over and over. The problem is : how well did I understand the instructions from the manual. Has I see the drawing only shows the beginning and the end of the winding. Could you give some more precise information about how you did the second time and/or what was different?

1524. Tune - Operate probem

Yahoo group: pfr3_group
Date: 2010-06-13 17:43:28 UTC
From: k9jri@att.net
Topic: 1524 Message: 1524

Everything works 100% on the PFR-3A that I completed yesterday except the SWR LED. My LED is full brilliance whenever the switch is in the tune position. It does not matter if the antenna connector is open or f a 50 ohm dummy load is connected.

I have removed and re-wound T2 paying particular attention to the direction of both windings even though I don't think that is critical.

I have performed normal Wheatstone Bridge DC resistance tests indicating that R49, R50 & R51 are the correct values and that the 5 turn primary of T2 is properly connected and has continuity as does the connection through S9 to the antenna connector.

D3 tests good although I have not replaced it. I have removed R48 and replaced it with much higher values thinking that the LED (D4) might have been much more sensitive that originally called for. I can get almost full brilliance on D4 with a 10K resistor in R48.

It is almost as though the core material is wrong.... acting more like a capacitor than a transformer. There is a typo in the document calling the core an FT37-43 on the schematic and parts list (2 cores) but was called a FT43-37 in the installation step on page 11 of the manual.

Has your SWR LED test function performed correctly?

Any ideas??? There are only 7 components in the whole circuit.

1527. TX problem...

Yahoo group: pfr3_group
Date: 2010-06-13 22:30:32 UTC
From: bbotlqw
Topic: 1527 Message: 1527

Just finished assembling my PFR3, and ran into a problem. During the TX smoke test, I didn't get a reading on pins 1 and 13 of U8, but did not think much of it, as it said since the signal there is a square wave, the DMM might have a problem reading it. Since the voltage on L7 was OK, I continued. But when I first tried the rig, I switched it to tune, and keyed up, but the led didn't light up. Switched back to operate and tried to answer some CQs, but never a response (by the way, I screwed up my dummy load/wattmeter... have to fix that too!). Started checking some voltages, and realized that when I check R37 and key up, the led lights up, and I get some voltages on pins 1 and 13 of U8! And if I keep on keying, it will continue. But as soon as I stop and try keying up again without the Voltmeter across R37 (or pins 8 & 9 of U8), no TX. But whenever the Multimeter is connected across R37 and I key up, bingo! I have checked all of the solder joints, removed and reinstalled U8, but still the same scenario... any ideas? Hope to get this ready for field day!

From: k9jri@att.net
Topic: 1524 Message: 1528

I received one direct reply that indicated a similar problem on a uni built about 1 year ago. His LED decreases only slightly when the SWR goes down when tuning.

I have tried the following:

I removed T2 completely and replaced it with the transformer from Dan Tayloe's SWR indicator that is sold by Hendricks. Exactly the same results using Dan's tapped coil (autotransformer) design as with the original T2.

My next step was to remove Dan's autotransformer and just take some RF voltmeter readings around R49, R50, R51 and the dummy load. I had previously taken DC resistance readings around the bridge and across the bridge's balance point (where T2 prmary connected) and these reading were correct.

The RF voltmeter readings are not correct though. With a proper RF dummy load connected to the antenna connector I read almost 8 VRMS across the balance point on the resistive bridge. When I read across R50 ad R51 the readings were very close at a bit over 7 VRMS but when I read across R49 the voltage was only about 2.5VRMS and only about .9 VRMS across the dummy load. All four of these reading should be quite similar.

My conclusion is that T2, D8, R48 and D4 are working correctly as the SWR bridge IS unbalanced and is correctly lighting D4.

My GUESS is that either R49, R50 & R51 are not non inductive resistors or the circuit board layout is causing a severe unbalance in the leg toward the antenna connector. My guesses have not been too good in the past from time to time.

I would appreciate any input from any PFR3A user on how well the SWR LED works. Will it go out or get quite dim when the SWR is low?

From: Blake Michael
Topic: 1527 Message: 1529

I suspect that you are picking up noise in the voltmeter leads and U* is doing what it can to make useable output from it. I used both a Fluke 97 and a Craftsman DVM to measure mine. Both easily read the signals coming out of the DDS chip. I would look that over again.... you can listen for the signal in another receiver as well. It should be quite easy to hear if you bring an antenna connection close to the board.

Good luck!

From: Dale Putnam
Topic: 1524 Message: 1530

Without breaking off what I am envolved with right now, bear with me while I access dusty memory... but the led in the A model was being overdriven by the bridge, and Steve made a resistor change to lessen the drive to the led, and allow it to not be "brilliant" all the time.

This is posted, I'm sure in the archives. I've gotten my bench covered with AT3s/K2 now, and there just isn't enough room to spread out one more manual. If a check of the archives isn't fruitful, and the resistor hint doesn't pan out, I hope to have enough of this done, to make room by morning. Maybe it can be found by then. The summary is that the led may show bright, but there is a match, indiated with a little dip in brilliance, until the resistor is changed, then it behaves more like expected.

Have a good evening,

From: Blake Michael
Topic: 1524 Message: 1532

Problem solved.

1. My expectations regarding the SWR LED were not realistic. It will not dip in brightness using a 50 ohm dummy load connected to the coax BNC jack. No way to balance out all of the internal stray capacitances and stuff. My LED shows no detectable change in brightness with the dummy load (Hendricks QRPdummy load) connected or disconnected.

2. It will dip in brightness when using the internal BLT or an external tuner connected to the coax BNC jack. I did find that replacing the 480 ohm LED current limiting resistor (R48) with 4,800 ohms makes the dip in brightness much easier to see.

3. My internal BLT was not working due to an intermittent Tune capacitor. Loosening the mounting screws on the poly variable cured this problem. It acts like a plate is shorting inside when you turn t with the screws tightened. I have requested a new variable from Hendricks Kits but that will take a while as they are down for the month. It is woking no though with the loosened screws.

All is working 100% now and, as I mentioned before, the receiver is really sharp and is quite sensitive.

Hi Steve -
BTW your email address is broken today. I get permanent failures.

I'm still plugging away at my pfr 3a.

messed up the first circuit board (Please don't ask) so I bought a new circuit=
board alone. I ruined L4 and L5 desoldering them. I have been looking for =
a source and cant find any on the net or in town.

I put out a want on eham and yahoo "need for my PFR-3A one 2.2 uhy RFC 5% = (Red Red Gold Gold)"

A kind soul Bill W0LPQ sent me 2 light green inductors that are the same size physically but they are light (lime ?)green in base color and is Silver Red Red Silver for bands. He said they are the correct ones but is using this chart at the bottom I need your blessing before I put them in. I know if I wait until next month qrpkits.com will be reopen. but Id like to keep moving along.

anyway the parts (same size physically but they are light (lime ?)green in base color and is Silver Red Red Silver.)

and his feelings below

"Rich ... the chokes I am sending are according to this code ... at the very bottom ..., Molded Chokes

http://www.techlib.com/electronics/colorcode.html

73"

Can I use them or should I wait?

thank you in advance.

Rich,

What he sent you are .22uH not 2.2. You -cannot- use .22 in that part of the circuit.

FWIW, the body color is not critical, it's the band following the two reds which is the multiplier. Red-red is 22. Silver is .01. 22 X .01 is .22. Gold is .1. .1 X 22 is 2.2.

I still haven't found any here but I haven't given up looking.

73.......Steve Smith WB6TNL

Once again Sicom you saved me from shooting myself in the foot.
I have to say though, that ham that sent the .22 u was very kind and generus to do so.

I wonder why they are hard to find. Ill just wait until qrpkis opens back up.

I have to say this is the most helpful group I have been in.

1537. Re: Tune - Operate probem - Circuit board change

Yahoo group: pfr3_group
Date: 2010-06-15 00:38:34 UTC
From: k9jri@att.net
Topic: 1524 Message: 1537

I found an older photo of a previous version of the PFR3 circuit board. On the older board a coax cable attaches to the circuit board right at the "COAX/BLT" switch. On the newer, current, board the 50 ohm connection is a circuit board foil that goes on both sides of the board to get to the output connections.

My "GUESS" is that this is enough to introduce sufficient reactances to cause the bridge to not balance when a dummy load is plugged right into the BNC connector.

I think this project is now COMPLETE :) I guess I had better brush up on my CW now.

Very 73 - Mike - K9JRI

--- In pfr3_group@yahoogroups.com, Blake Michael <k9jri@...> wrote:
>
> Problem solved.
>
> 1. My expectations regarding the SWR LED were not realistic. It will not dip in brightness using a 50 ohm dummy load connected to the coax BNC jack. No way to balance out all of the internal stray capacitances and stuff. My LED shows no detectable change in brightness with the dummy load (Hendricks QRPdummy load) connected or disconnected.
>
> 2. It will dip in brightness when using the internal BLT or an external tuner connected to the coax BNC jack. I did find that replacing the 480 ohm LED current limiting resistor (R48) with 4,800 ohms makes the dip in brightness much easier to see.
>
> 3. My internal BLT was not working due to an intermittent Tune capacitor. Loosening the mounting screws on the poly variable cured this problem. It acts like a plate is shorting inside when you turn t with the screws tightened. I have requested a new variable from Hendricks Kits but that will take a while as they are down for the month. It is woking no though with the loosened screws.

1538. Re: Tune - Operate probem - A confession and a question

Yahoo group: pfr3_group
Date: 2010-06-16 12:14:47 UTC
From: k9jri@att.net
Topic: 1524 Message: 1538

Not being able to let the SWR LED issue alone even though I thought that it was affected by the circuit board change I decided to do two additional tests:

1. Replace the Hendricks QRP Kits dummy load with my 300 watt MFJ dummy load. SURPRISE the SWR LED Went completely dark. Obviously something wrong with the QRP dummy load.

2. Test the Hendricks QRP dummy load. DC resistance tests with a Fluke 77 read 49.8 ohms. I then attached the QRP dummy load to my MFJ SWR analyzer and it read and SWR of 15.4, X=2 and R=1 ohm. I really didn't know how that can be possible so I did some additionl tests and found that the detector diode, on the dummy load, was shorted. When removed the QRP dummy measures 1:1 on the MFJ and the SWR LED completely extinguishes on the PDR-3A.

This is the second time that a defective piece of test equipment led my a long way down the wrong road.

Sorry I inflicted the pain on the group as well but all is well now,

Thanks again - Mike

Winston, I just did a BitX20A, Retro-75, NADC-40 and a PFR-3A. The PFR-3A is a VERY EASY kit to put together and mine worked well first time. In fact the only problem that I had with it were the fault of a bad piece of test equipment.

While the coils and transformers initially looked pesky to wind they were really quite easy. The documentation is not HeathKit quality but more than adequate to have fun and a successful build. The toughest part of the whole kit id putting the decals on the cabinet :)

The PFR is actually easier to build than the Ten Tec single banders. If you
can
get your magwire tinned properly on the coils and transformer you will have
no problem.
The magwire is the heatstrip variety so it is actually pleasurable to use.
The only thing
that folks I have let try the rig have had problems with is the pushbutton
tuning... it
actually becomes second nature after a few sessions.

As far as test gear, you will need a DMM, a watt meter, and a freq counter.
You could
get by without the freq counter too.

I took out the coil, re-melted the leads, sanded them clean, and resoldered them to the side of the board with the tracks. I also checked for continuity. I powered the rig back up and nothing happened, just the usual LED brightness. Any otehr suggestions? --- In pfr3_group@yahoogroups.com, "hzp_electronics@..." wrote: > > Joey,I had the same problem. Check that the coil wires are soldered to the side of the side of the board with the tracks. On mine, that is the same side of the board as the coil is on. The problem is that some or all the holes are NOT plated through and there is no connection. I did not measure a short circuit between my two balanced terminals. Good Luck. .... Bill K3HZP
I just completed the kit and everything worked OK until I tried the tuner. From what I can tell I wound T3 correctly, and all the varicaps have good connections. No matter how slow I adjust the Load and Tune, the LED never gets dimmer. Any help?

It is very sensitive, I thought that mine was not functioning when it actually was. Curt Milton helped me out with some tips on testing it and the first was to be sure I had the switches in the correct position and see if there is an audible difference as you adjust the variable caps. Peak the band noise and a smidget one way or the other dims the LED. Mine will actually tune up all 3 bands on a half size G5RV but it is very touchy... it took a bit of practice. The tell here is really if it affects the noise level on the band. If you are getting some peaking of the noise, it is working, at least to some degree. You may or may not get a complete blanking of the LED (depending on the antenna), but peaking means it is working.

Yes, Charlie: I used the advice posted previously, Steven Weber recommends the use of 1k ohm resistor instead of 470 ohm for R48. The LED SWR indicator works great, very intuitive watching the little light go from bright to dark. Oh, Charlie - you should get a PFR3 - very fun to build! http://www.youtube.com/watch?v=wJs2iYGd-VA

Hi Lynn,

I am an owner of a PFR-3, built by me in early 2009, with coils wound by a ham friend (her fingers work better than mine on a toroid). I agree; fun to build, great receiver, tuner worked first time tried.
I meant to say that I don't have the "-A" model.

Well I replaced the 470 ohm resistor with a 1K like mentioned, and fired up the rig. I was on 40m with a 40m dipole that is pretty close to about 1.5 SWR. When I set the three switches to TUNE, COAX, and LOW-Z, turning the knobs did not affect band noise from what I can tell. Also trying to tune the antenna resulted in the LED staying the same brightness. Could it be the varicaps?

Joey,

I believe your problem might be the switch on the rear. If you are using the BLT but connecting via the coax connector the switch on the back must be toward the binding posts. That is counter intuitive but is a common problem. Check the schematic and you will see why.

Could be - I think Doug had a few that were bad a while back, but really shouldn't be. Are you sure the varicaps are wired right? Is the ground connection solid?

Excellent response. Part of the KISS approach - often the most simple thing.

I helped build a Heathkit amp years ago and when we finished it would not work.Should have, but we had nothing. Traced and check and ohmed the heck out of everything. Touched up a lot of solder connections - all that sort of thing. The owner sent it to Heathkit and they sent it back saying it fired right up and produced the proper power. Even commented on the quality of the build. He tried it at his house in the station and nada. Sent it back, they said the same thing and sent their testing results/remarks. He tried it at home, still nada.

Only when I checked the wall plug did we find that one side was dead. All was okay, but we took the long approach instead of the most simple, and I've found over the years that when careful building, it is nearly always the most simple thing that is actually wrong.

UPDATE: I now have the rear switch set to the binding posts,then the other three to TUNE, BLT, and LOW-Z. I am able to get the LED to dim. Are these the correct switch positions to tune a coax-fed antenna?

Yep. Congrats. Might try the Low-Z - High-Z switch to see if it improves,
but if you have black or serious dim, you have it now.

>varicaps?

The way you have the switches set you are by passing the BLT tuner and
connecting directly to the BNC coax connector. The BLT -COAX switch needs to
be in the BLT position to connect to the tuner.

In order to use the BLT tuner with the BNC coax connector, you need to set
the switch to BLT and then use the toggle switch on the back panel to
connect the coax connector to the binding posts (BLT output)

Yes, this is a little confusing, but clearly explained in the instruction
manual.

Steve, Glad to see you on the group. I hope this means that you are progressing nicely towards a recovery.

As a followup to our conversations regarding the power output of my NADC-40, I lowered the input voltage on my PFR-3A to 9 vdc so that the PFR-3A would have about the same voltage as the NADC's finals have.

The results were about 2.3 watts output, from the PFR-3A, on 40M so it looks like all is well in the NADC-40 with the 2 - 2.5 watts output that I have.

I do have kinda semi permanent custody of the Tektronix 475A scope now though so that was a real boon to the project.

Very 73 - Mike - K9JRI

One last question: I assume that I leave the rear switch to the binding post position to operate the coax antenna?

Only if you are using the BLT. If you are not using the BLT then the switch should be toward the coax connector. Otherwise the BLT will be bridged across the coax connector.

I posted a couple of weeks ago about a problem I am having with my PFR3, and have not found the answer yet...

The TX does not seem to work unless I connect my Voltmeter across the ground and pin 16 of U6! When I do, then the tuner led lights up and all the correct voltages are there. But if I key up without the voltmeter, nothing happens! I am having no success and am really hoping someone has an idea! Can anyone help?

I really appreciate it!

I would first check the connections to R37, which is the pull down resistor for that node. The other possibility is Pin 16 of U6 is not soldered well and only makes connection when you touch the probe to it.

Thanks for the tips Steve,

R37 is good, and I have checked the solder connections and redone them to make sure. Here are some more details about the issue:

1) When I key up, the tuner led does not light up, and there are no voltages present on pins 1 and 13 of U8 (I don't have the schematics in front of me, but I believe those are the pins...)

2) If I put my voltmeter across the ground and pin 16 of U6, or across R37, or across pins 8 and 9 of U8 and key up, the tuner led lights up and the rig transmits.

3) If I keep on keying up while removing the voltmeter, the led stays lit and the rig keeps on transmiting. If I then stop and try keying up again, I am back at square one; ie the led doesn't light up, and no voltages on pins 1 an 13 of U8.

4) The resistor R37 is the correct resistance, and I have redone all the solder joints on U8.

I'm not sure what would be doing this, but could it be a logic issue? I mean, it seems like it's working fine, or not working, and I'm wondering what the voltmeter is influencing? It's on or off.

Thanks!

well right now it is deaf as a doornail except for the keyer and button beeps.

Once in awile Ill hear the russian pulse radar sound, no cw though.
I fired up my Icom on 40 meters and sent some cw. Heard it really low, then I touched the edge of the pfr 3a board and I could hear the Icom great..... but still no other cw on the band. tuning through on the Icom and I hear the band very active.

what do you think..... Cold solder joint? Has anybody found this and fixed it on their radio?

Once again, Thank you in advance.

Rich,

Is the DDS working? If you take a wire and put it near the DDS chip and hook it to your Icom and tune to 11.9425 MHz, you should be able to hear it. The DDS provides the LO which the receiver section needs to receive signals.

Hi Larry
thank you for your reply,

On my freq counter Im geting 9.999 but from the setup menu although the switches change freq. they dont have any effect on the freq counter.

I have to assume that "key up" means "key or inputs are closed circuit"?

What is the the actual value of R37 in ohms? If you have a high impedance voltmeter or VTVM can you measure the voltage on pin16 U6? With "key down" what is the voltage on pin 16 U6. Should be ~ 1.5 V if the DDS is working.

I had a similar problem

Best of luck, Grant

Hi All,

I built the earlier PFR-3 and use it all the time. This is an enjoyable kit to put together and even more fun to operate. However, I have never gotten around to building the second early kit and have decided to sell it. All components are in unopened bags. The price is $165, which includes shipping.

Thanks,

Tim, K6OM

You're making a wise decision. The second kit is equally fun to build except the case comes with decals instead of being silk screened....and they're not very good decals. The changes between the first and second units aren't significant. I built a 3A for a friend. That's how I know!! hi Steve N0SM

Sorry to bug you guys again but I have another question: When I power up the radio, the band noise sounds normal, and then I hit the paddle just for 1 dash, and the band noise completely dissapears. I have to wait a couple minutes before I can power the radio back on and the band noise re-apperas, only to be muted when I hit the paddle again. Any ideas?

Hi Grant,

Yes, the voltage is around 1.5 (1.70), but only when the voltmeter is on... What I mean by that is that as soon as I key up (or key down... I guess it depends if you're upside down or not, hihi!) with the voltmeter on, I read 1.70 volts, and the tuner led lights up to the rythm of the dits or dahs. But if I key down without the voltmeter on, then the led doesn't light up... and when I put the voltmeter on to check the voltage, then the led lights up... you see? What could the issue be?

After looking at the schematic again the only possibility I can see is this :

1. the inputs to the quad NOR gates are "floating" so check the ground connections on U8. you may have cold or poor solder joints on the ground pins.
2. Check the R37 solder joints.
3. What kind of voltmeter are you using to measure the resistance and voltage? Is it high impedance, VTVM, DVM ?

You still haven't reported the R37 resistance; do you measure from pin 16/U7 and pin 2/U8? This can be enlightening.

all the best, Grant

1583. PFR-3 BLT against SLT tuner

Yahoo group: pfr3_group
Date: 2010-07-11 17:27:53 UTC
From: lÃ±aki
Topic: 1583 Message: 1583

Hello guys,
I own a PFR-3, using it all the time with a random long wire. (trekkings in the mountains). Sometimes (often) I have difficulties to tune and get a decent SWR. So I am thinking of taking a tuning device. Thinking of volume/weight, I like the SLT offered by Hendricks.
Is there any advantage (clear advantage) in using the kit SLT (Switched longwire tuner plus) against the BLT of the PFR-3?
Do you have an idea of impedance range handled by the SLT ?
Can anybody give me the external dimensions (excluding knobs) of this SLT kit?
Thanks in advance.
73

Hello Iñaki,

The BLT is primarily a tuner for antennas fed with balanced feedlines and won't do very well with loads above 500 Ohms and below 50 Ohms.

The SLT is not a general purpose tuner. It is designed specifically for end-fed half-wave wires. That means the matching range is approximately 2K-5K Ohms.

If you are home-building one you could add a switch that moves the variable capacitor to the input. That would make it a high-to-low impedance network and increase the matching range. That might help 'fill in the gap' in the matching range of the BLT and SLT.

BTW, the SLT is no longer available as a kit from Hendricks. It has been replaced by the SLT+ which increase the frequency range to include 80 meters.

Best of luck and 73

Thanks for fast answer!!!
Let me do one more comment, as my knowledge of antennas is very limited.
Yes, I see that the BLT works fine to tune dipoles that need some minor adjustment, or my home vertical caox fed.
However, my pain is when I backpack with a "10m-12m or so wire" and I want to tune in every band for a few QSOs. (or at least in a couple of them)
The conditions (weather and time) I usually have at "3000m height" often do not allow me for measurements and adjustments, so I need a "real tuner".
But, a "real tuner" weighs and get a high volume or require bateries or....
What is your advise? Do you think the "SLT Plus kit" might be a good choice to increase the chances of tuning (knowing it will not do any miracle)?

Regarding the mod you propose..., could you be a bit more specific? Again, I am not good at this things and need idiot's proof guidelines...
Many thanks again.
Iñaki

From: lÃ±aki
Topic: 1586 Message: 1586

Hello,
My PFR-3 works perfectly with iambic paddle, but no way with straight key.
I put mono plug and then switch on the rig, but it does not work like straight key.
MIght it be the chip mentioned in many other posts?
Am I doing anything wrong?
Thanks and 73

1587. Band Changing on its Own

Yahoo group: pfr3_group
Date: 2010-07-12 10:22:36 UTC
From: Bill
Topic: 1442 Message: 1587

I believe I've fixed the problem I had with my PFR-3 switching to 30 or 40 meters at random for several seconds. I think there was at least one other person in the group with the same problem.

After replacing the CPU chip (thanks, Steve, my old chip will be in the mail tomorrow morning) and finding it didn't fix the band changing problem, I took a look at the schematic and found a capacitor listed as C62 on the schematic in parallel with the resistors handling the voltage drop controlling band selection (there's another C62 in the low pass filter), but listed as C76 on the PC board layout. Ohming it out, I found a cold solder joint. Reflowing the bad connection fixed the problem.

Hi again guys,
This is solved.
Plug stereo wired like mono, but you must switch the rig on while straight key is transmitting (key down).
It works then like straight key.
Thanks

Use the HI-Z BLT setting, set the coax/binding post toggle switch on the back of the rig to coax (this will ground the black binding post) Now connect a wire about 20% shorter than a 1/2 wave on 40 M to the red binding post and a counterpose wire to the black binding post (this can be 4-5 M, 12-15 feet long) You then should be able to tune up on 40 and 20 and maybe 30.

Many thanks Steve.
Really supportive.
Let me try it out and I will come back if still there are problems.
The counterpoise might be the difference here.

From: wb9dlc
Topic: 1586 Message: 1591

My PFR3 does not work in SK mode, either. I posted this 'issue' before and got no response from the group. I emailed Steve Weber and he said that he knew of no software issues.

Yet, it worked before I obtained a new software chip from Steve (the original software had all kinds of keyer issues). The new software solved the keyer issues and introduced the SK problem.

I can't believe that it is a hardware issue since it worked before and it works great with a paddle. I know that Steve had a couple of versions of the software.

The sympton : Start the rig in SK mode - receives fine until you hit the key. At that point it never returns to RX mode and has a nasty sounding sidetone. You have to power off/on to get back to normal RX.

I would be interested to know if different software (newer or even older) would fix the issue.

Hello- MAYBE you are trying to load too short of a wire, the tuner is VERY picky. I have found (through experimentation) that my PFR internal tuner works well with a 16.7 meter wire to the red post and 1/4 Mtr. counterpoise wires to the black post for EACH band (10.15, 7, 5 meters respectively, thin magnet wire works fine). I would try using different, longer lengths of antenna wire before giving up on the internal tuner. If all else fails, I highly recommend the Emtech ZM2 QRP tuner; although it might be a bit larger/heavier that you would like for backpacking. Best of luck and Happy Trails! de k7hv

Thanks for the reply,

The resistor r37 is 97kohm, wich is what it should be (100k). I will check and redo the solder joints again (for the third time now...) and check the ground connections on U8. I am using a digital multimeter (10Mohm impedance)to measure voltages and resistances. And I have measure both resistance and voltage from pin 16 of U7 to pin 2 of U8, directly at the resistor and at pins 8 and 9 of U8. Hope this is enough info, and I hope to find a solution soon!

Thanks everyone for your help!

Thanks John and all others involved in the assistance.
Yes, you are completely right. First of all I am trying with some 15-16-17m wire adding a counterpoise. If I manage that, it will save me one device, being by far the best solution. (actually I chose the PFR-3 because the tunner was included)

Regarding this EMtech tuner you mention... I heeard wonders about it. I keep it in mind. This summer, I will intensify my tests in the mountains.
Many thanks for all your help. I feel proud of being part of this group!!

Hi Iñaki and the Group,

My 2 cents :

1 - if possible stick to the advice of Steven, the BLT is capable to tune almost any LW providing you also have a grounding or counterpoise (which is also radiating)

2 ☐ the Emtech ZM-2 is not ☐the☐ reference any more, there is a new version : ZM-4. In Europe, the kit is available at QRP-Project DE : http://www.qrpproject.de/UK/ZM4.html

I own it, it works great and tune just anything (also on 160m band). And the service provided by Peter and Nikolai is first class.

Have fun on the roof of the world,

Hi Steven,

Previously I had used a 1/2λ on 40m. But for casual operation in my in-laws backyard, a shorter antenna was easier to install so this weekend I tried a 10.4m (34ft) wire with ~4.6m (15ft) +/- counterpoise. I had a great time operating portable from NW Iowa using this wire as a vertical antenna. The 10.4m antenna worked as a 1/4λ on 40m, 0.35λ on 30m and 1/2λ on 20m. It loaded with full dimming of LED on all three bands.

On 40m it was very easy to find resonance with BLT. On 20m and 30m, with this 10m wire, it took more care to find the match settings the first time. I found that very small incremental changes as trial positions of the LOAD cap followed by "fine tuning" the TUNE cap worked best to get the LED to fully dim. Yes, on 30m with this antenna tuning is very very sharp and there is only one precise setting for the "LOAD" cap, but once the settings are known for a particular antenna and counterpoise arrangement it is easy to find again. Hi-Z setting used. I made sketch in notebook for cap dial positions which made it easier to return. Repositioning antenna or counterpoise obviously changes the dial settings somewhat.

Here is a video showing a couple sample QSO's I made with that antenna. The first QSO in video is with K8MP, Joe in Delaware, OH a 600 mile 40m contact. The second recording is KD3DK, Jerry in Houston, PA a distance of about 750 miles on 20m. Good reports. On 20m the 1/2λ length is probably ideal for low angle radiation lobe, and using one antenna for all three bands was convenient.

http://www.youtube.com/user/NG9D#p/u/12/3kWvXJ_5XgE

PFR3 internal PS, keyer and BLT really make portable operation convenient. Amazing little device. The only mistake I made was not taking your (AGC) advice and to reduce the volume while tuning around the band. K6XK blew my eardrums out on 7020kHz - still ringing... Congratulations on designing a superb QRP radio Steven! I look forward to assembling the PFR3 paddle next!

Use the HI-Z BLT setting, set the coax/binding post toggle switch on the
back of the rig to coax (this will ground the black binding post) Now
connect a wire about 20% shorter than a 1/2 wave on 40 M to the red binding
post and a counterpose wire to the black binding post (this can be 4-5 M,
12-15 feet long) You then should be able to tune up on 40 and 20 and maybe
30.

A couple other details I forgot to mention. I used the toggle switch set to the 'balanced line' - not the 'coax' position (as shown in the pictures on the video link). That was the only way it would tune, and the audio strength of the signals was noticeably better in the 'balanced line' position when using the 10.4m wire and 4.6m counterpoise. Both wires insulated, and counterpoise laying on ground.

73 all!

1602. end fed antenna for 40 and the PFR-3

Yahoo group: pfr3_group

From: va3ied
Topic: 1602 Message: 1602

Hi Folks,

Been reading some of the discussion re: antennas and the PFR tuner. Presently I am running 450 ohm window line to a 1/2 wave dipole. Switched to 'Bal line" and tuning thru the tuner (I assume thats correct) From what I understand, an end fed arrangement would be appx 34 feet of wire connected to the red terminal, 10-12 feet wire to the black terminal (counterpoise laying on ground) and the switch pointed to the 'coax' side. Does that sound correct? Appreciate your thoughts.

Hi Scott,

A useful variation on a 20m endfed antenna is a half-wave of wire (34 feet) plus a quarter-wave of twinlead. You'll have to calculate the length of the twinlead since it includes the velocity factor. What this does is covert the high impedance of the endfed half-wave to a lower impedance that's easier to match to. It also enables you to get the center of the radiating wire up higher for a better signal.

I've used this as a "camper antenna", and it works quite well with a balanced line tuner. No counterpoise needed.

It seems to me that the direct end fed half wave would be higher impedance than the coax output would like. If you connect the counterpoise to the black post and the antenna to the red one switch to "bal", it may like it a lot better. Have a great day

1607. Rotary encoder for PFR-3...

Yahoo group: pfr3_group
Date: 2010-07-23 10:07:38 UTC
From: Petr
Topic: 1607 Message: 1607

Hello,

I would like to share with You the link for very nice add-on kit suitable also for PFR-3. An article about the rotary encoder is here:

http://diy4fun.blogspot.com/2010/01/rotary-encoder-for-ats-transceiver.html

The encoder was designed originaly for ATS radios. As I know it was tested successfuly by Dale, WC7S with PFR-3 also.

Even more electronics can be found overe here but the encoder is most interesting for us I guess. You can find here also some additional informations and pictures.

Did anybody else tested it with PFR-3 please?

1608. DigiPan, Digital modes and Windows 7

Yahoo group: pfr3_group
Date: 2010-07-25 00:09:02 UTC
From: Jim
Topic: 1608 Message: 1608

This message is being sent to several reflectors. If you happen to receive two or more copies, that only means that we have subscribed to several of the same amateur radio email groups. All of that said, my potential problem (?) is that in the not too distant future I might be able to get a new computer. This computer will, among other activities, be used for computer generated digital mode operation of an IC 706MK2G. At present, I use Digipan for most of these operations in digital modes. I would prefer not to get into any discussion about "this OS is better than that one" or flames along the same line. I have, although briefly, tried some of the operating system versions offered by Apple and one or two of the Linux versions. However, the greatest part of my computer experience (at least 20 years) has been with the various versions and incantations offered by Microsoft. Currently my computer uses Windows Xp with Service Pack 3 installed. When Windows Vista came out I remember reading several comments that the users were having trying to get the software (mostly rig control and logging) to work properly with Vista. Has anyone tried Digipan, or any other ham digital software, with Windows 7? Have there been any problems getting everything configured correctly?

Thank you for the time and the opportunity to post this question.

1610. no output and 20 meters only.....

Yahoo group: pfr3_group
Date: 2010-07-27 02:30:26 UTC
From: Rich
Topic: 1610 Message: 1610

after many months I finally got my PFR3A working. The board laying on my bench. I was so excited I measured 4.5 watts coming out and could hear signals, I had 20,30 and 40 meters. I picked it up to put it in the case, put it down to do something then went back to the board and case, I'm kicking myself but I forgot to disconnect the power and mounted (or started) it in the case. I think I might Probably) have shorted the board, when I turned it on again all the band switches are 20 meters and it has no output at all. Who knows if the tuner works.
Well based on my 15 minutes of use I really like the radio. I don't want it to end up being a $200 paperweight
Unless somebody here to talk me through troubleshooting I hope to send to steve W.

1615. DDS calibration

Yahoo group: pfr3_group
Date: 2010-07-30 21:05:31 UTC
From: wa9s_ckwishmeier
Topic: 1615 Message: 1615

Two small problems with my PFR-3A:

Using a Fluke frequency counter, the calibration mode and the tuning switches I am able to adjust the DDS clock to 10,000,000. BUT when I click the MENU switch to save my setting it just resets back to the original reading. I have assumed that when the manual says to click the KEYER switch it really means to click the MENU switch. The operating frequency is off by 200-300 hz and I would like to get it on frequency. Does anyone have any suggestions?

The second problem is that stored messages seem to mess up a few letters when sent faster than about 22 wpm. Suggestions?

Otherwise this little rig is absolutely incredible. I have been working stations all over the US and about a half dozen Europeans in the past week. Not the easiest kit to build because of the small part size, my eyes being 62 years old. But after I found two missed solder points everything else has been working perfectly. Any help would be appreciated.

Keith,

I had the same (unresolved) issue but in my case the default frequency was very close -- within 80 Hz! Shown at the 0:18 mark on this video:
http://www.youtube.com/user/NG9D#p/u/3/wJs2iYGd-VA

I have also been having a blast with this radio. I took it on a weekend trip and it played well with a 34 foot wire antenna on 40 - 20m:

http://www.youtube.com/user/NG9D#p/u/3/wJs2iYGd-VA

Am going to start building the paddle this weekend. I haven't tried the memory keyer function yet.

Lynn,

Steve kd1jv contacted me and gave me the easy solution. I was re-checking the 10,000,000 frequency every time before checking the T/R frequency against my standard. His chip design resets the DDS to the default value every time you enter the calibration mode. So when I just did the calibration, then tested the radio on the air, it worked properly!

I tried the PFR-3A in the field last night with a 53 foot wire and several different length counterpoise and was unable to get an acceptable tune-up on any band. In the home shack the tuner has no trouble either just fine-tuning my 40M dipole or tuning up 30M on the 80M dipole. With my LDG Z817 tuner and a 4:1 balun I could tune the wire antenna, but I felt that the noise level was too low, at least compared to my home antennas. What length counterpoise were you using with the 34 foot long wire?

The PFR-3A radio kit is VERY impressive. And I enjoyed your YouTube videos. They were great help. But as good as the radio is, the paddle kit that I received was very poor. Now to be fair, once assembled the paddle works very well. It's perfect for use in the field and the radio is heavy enough that it doesn't move around when using the paddle. So I want to say that I really like this paddle. Maybe my paddle kit was shipped with incorrect parts. The (4) stepped plastic washers that were to fit into the (4) holes in the spring steel arms would not fit into those holes nor into the holes of the (4) plastic washers on the back side of the arms. I went to my local hardware store and purchased a quality carbide drill bit and (4) new backside plastic washers. Then I drilled out the existing holes in the spring steel arms so that the stepped washers would fit. That solved that problem. However, I then discovered that the screws that are used to attach the arms to the aluminum block were too long as the threaded holes in the aluminum block are drilled and tapped clear through and the ends of the screws hit each other preventing the assembly from being tightened. That required another trip to the hardware store to get shorter screws. After going through all of this I came to the conclusion that simply obtaining new stepped washers, if available, would have been a better solution. I plan to contact Doug at Hendricks about this so that he can make corrections. Of course, maybe he reads this!

Lynn, let me know if you have the same stumbling problem with the memory part of the keyer. Otherwise the keyer works very well. I would absolutely recommend this radio and the paddle. I am delighted. In the past week I have worked about twenty contacts including both coasts of the US, British Columbia, Mexico, Brazil, France, Italy and Yugoslavia. Most of this was on 40M with my dipole!

Keith, Regarding the paddle I too found that the screws were too long but the easy solution was a small, properly sized washer under the head of the screw opposite the screw with the solder lugs. This provided the right amount of relief to tighten down the screws. My shoulder washers pressed in quite tightly and I suspect that it is supposed to be a close fit just to eliminate any possibility of "wiggle".

As for the memory keyer I was surprised that the memory is exactly that. It stores the actual spacing that I sent rather than perfectly generated "letters". My sending was not good enough to get a well spaced message into the memory. What I did was to record the message at a very low speed where I could control the spacing much better. When speeded back up to normal speeds it sounded pretty good.

Michael,

Thanks for your reply. The holes in the spring steel were 1/8" diameter. The shoulder washers were 3/16". Even when I drilled the holes out to 3/16" the washers were a tight fit.

I did the same wrt the keyer memory (i.e. sending slowly). As long as the memory sending is 20 wpm or less, the sending is fine. Above that it seems to fumble over one or two letters in the message. Not a big problem. I usually fumble a letter or two myself at the higher speeds!

Keith

Keith,

Thanks for info on resetting DDS chip when entering calibration mode, and your experience with 53 foot wire with several different lengths of counterpoise. I used a 15 foot counterpoise with 34 foot long wire. That 34 foot antenna was supported almost vertically in the canopy of a big linden tree. The feed point was indoors routed past a screen door. The counterpoise on the ground, also routed outside.

I used the rear switch set to "balanced line" and the impedance switch set to "Hi-Z" (both on 40m with wire as 1/4 wave and on 20m with wire as 1/2 wave antenna). Tuning on 40m was easy. Tuning on 30 and 20 was very critical and I noticed that even the capacitance effect of my finger on the capacitor knob made a difference! First I thought 20m was impossible, but once the very narrow resonance point was found the SWR LED would completely darken. It is hard to see on the video, but the approximate positions used to tune the antenna were (with caps centered at "12 O-Clock"):

band / load / tune
40m / 10:00 / 11:00
30m / 1:00 / 2:00
20m / 2:00 / 3:00

I think that the capacitor settings, especially when higher impedance feed is presented, will be strongly affected by the surroundings. I will try that same antenna in a different setting to see how it affects the loading.

Also thanks for your advice on the keyer. I will defer the construction to see if you get a reply on those issues. In the meantime, seems like an opportunity to do more experimenting with antennas and trying out the memory keyer! Yes, the PFR-3A radio kit is impressive. It is one of the most rewarding kits I have built - got the same warm es fuzzy feeling building HW-101,

Subject: Re: [pfr3_group] DDS calibration

Lynn,

Steve kd1jv contacted me and gave me the easy solution. I was re-checking the 10,000,000 frequency every time before checking the T/R frequency against my standard. His chip design resets the DDS to the default value every time you enter the calibration mode. So when I just did the calibration, then tested the radio on the air, it worked properly!

I tried the PFR-3A in the field last night with a 53 foot wire and several different length counterpoise and was unable to get an acceptable tune-up on any band. In the home shack the tuner has no trouble either just fine-tuning my 40M dipole or tuning up 30M on the 80M dipole. With my LDG Z817 tuner and a 4:1 balun I could tune the wire antenna, but I felt that the noise level was too low, at least compared to my home antennas. What length counterpoise were you using with the 34 foot long wire?

The PFR-3A radio kit is VERY impressive. And I enjoyed your YouTube videos. They were great help. But as good as the radio is, the paddle kit that I received was very poor. Now to be fair, once assembled the paddle works very well. It's perfect for use in the field and the radio is heavy enough that it doesn't move around when using the paddle. So I want to say that I really like this paddle. Maybe my paddle kit was shipped with incorrect parts. The (4) stepped plastic washers that were to fit into the (4) holes in the spring steel arms would not fit into those holes nor into the holes of the (4) plastic washers on the back side of the arms. I went to my local hardware store and purchased a quality carbide drill bit and (4) new backside plastic washers. Then I drilled out the existing holes in the spring steel arms so that the stepped washers would fit. That solved that problem. However, I then discovered that the screws that are used to attach the arms to the aluminum block were too long as the threaded holes in the aluminum block are drilled and tapped clear through and the ends of the screws hit each other preventing the assembly from being tightened. That required another trip to the hardware store to get shorter screws. After going through all of this I came to the conclusion that simply obtaining new stepped washers, if available, would have been a better solution. I plan to contact Doug at Hendricks about this so that he can make corrections. Of course, maybe he reads this!

Lynn, let me know if you have the same stumbling problem with the memory part of the keyer. Otherwise the keyer works very well. I would absolutely recommend this radio and the paddle. I am delighted. In the past week I have worked about twenty contacts including both coasts of the US, British Columbia, Mexico, Brazil, France, Italy and Yugoslavia. Most of this was on 40M with my dipole!

Keith,

I had the same (unresolved) issue but in my case the default frequency was very close -- within 80 Hz! Shown at the 0:18 mark on this video:
http://www.youtube.com/user/NG9D#p/u/3/wJs2iYGd-VA

I have also been having a blast with this radio. I took it on a weekend trip and it played well with a 34 foot wire antenna on 40 - 20m:

http://www.youtube.com/user/NG9D#p/u/3/wJs2iYGd-VA

Am going to start building the paddle this weekend. I haven't tried the memory keyer function yet.

Subject: [pfr3_group] DDS calibration

Two small problems with my PFR-3A:

Using a Fluke frequency counter, the calibration mode and the tuning switches I am able to adjust the DDS clock to 10,000,000. BUT when I click the MENU switch to save my setting it just resets back to the original reading. I have assumed that when the manual says to click the KEYER switch it really means to click the MENU switch. The operating frequency is off by 200-300 hz and I would like to get it on frequency. Does anyone have any suggestions?

The second problem is that stored messages seem to mess up a few letters when sent faster than about 22 wpm. Suggestions?

Otherwise this little rig is absolutely incredible. I have been working stations all over the US and about a half dozen Europeans in the past week. Not the easiest kit to build because of the small part size, my eyes being 62 years old. But after I found two missed solder points everything else has been working perfectly. Any help would be appreciated.

A 34 foot wire will 1/4 wave on 40 so low impedance setting should be used.
On 20, it will be 1/2 wave so high impedance setting should be used there.

The problem with the keyer memory acting up is a firmware problem and can be fixed by letting me know you want to have it fixed. If so, we do a chip swap, where I send you a new chip and you send back the original for recycling.

Hi Steven,

Thanks for the info on the tuner settings. Yes, at first I thought the low impedance setting must be used for this antenna since the radiating element is 1/4 wavelength long. But I forgot that this is not a grounded antenna. The 4.6m counterpoise is on the ground, but not grounded and the total length of the antenna system conductor is 10.4m+4.6m = 15m, which is 0.35wavelengths on 7MHz. The transmitter is connected at the 30% point along this conductor, and 60% projects up as the radiating part, nominally clear of nearby objects. Since this 0.35 wavelength conductor/offset fed system is not resonant, the impedance will be somewhat higher than it would be for a resonant 1/4 wave antenna connected to an earth ground (i.e. Marconi antenna) or a full 1/2 wavelength center fed antenna clear of earth influence, and that is why the "Hi-Z" setting works on 40m with this particular arrangement..

I just checked it again, putting the radio and antenna system outside on the deck, clear of the house structure, etc. The antenna this time was held up by a tree and the counterpoise laying on, but insulated from, the ground. I found that the system tunes 40m with the impedance switch in both "Hi-Z" and "Lo-Z" with complete dimming of the LED. The reason I used the "Hi-Z" setting, tuning seemed easier, but mainly the noise (and signals) seemed noticeably louder with the "Hi-Z" setting and so I think it provides a better match with this particular total conductor length (radiating element plus counterpoise) over highly conductive ground.

The antenna works well on all bands. On 30m the total conductor length of this antenna is 1/2 wavelength. again the transmitter is connected at the 30% point along the 15 meter conductor. The radiating element is 0.35 wavelength long, the counterpoise is 0.15 wavelength long . On 30m, it will also tune in both "Hi-Z" and "Lo-Z" setting, but again "Hi-Z" seems to work best. On 20m the total conductor length is 0.70 wavelength. The radiating element is 0.50 wavelength long, the counterpoise is 0.2 wavelength long. On 20m I have only been able to get a match using the "Hi-Z" setting which makes sense. You have designed a miraculous radio. It is a blast to use!

This 15m (10.4m long antenna + 4.6m long insulated counterpoise) system is easy to deploy. If one is interested in low angle radiation it is easy to get the 34 ft part nearly vertical with an easy toss of a tether which will radiate well 40/30 and 20 meters. To go too much longer on 20m would spoil the low angle radiation properties I think.

73,
Lynn

Subject: Re: [pfr3_group] DDS calibration

Hi Steven,

Thanks for the info on the tuner settings. Yes, at first I thought the low impedance setting must be used for this antenna since the radiating element is 1/4 wavelength long. But I forgot that this is not a grounded antenna. The 4.6m counterpoise is on the ground, but not grounded and the total length of the antenna system conductor is 10.4m+4.6m = 15m, which is 0.35wavelengths on 7MHz. The transmitter is connected at the 30% point along this conductor, and 60% projects up as the radiating part, nominally clear of nearby objects. Since this 0.35 wavelength conductor/offset fed system is not resonant, the impedance will be somewhat higher than it would be for a resonant 1/4 wave antenna connected to an earth ground (i.e. Marconi antenna) or a full 1/2 wavelength center fed antenna clear of earth influence, and that is why the "Hi-Z" setting works on 40m with this particular arrangement..

I just checked it again, putting the radio and antenna system outside on the deck, clear of the house structure, etc. The antenna this time was held up by a tree and the counterpoise laying on, but insulated from, the ground. I found that the system tunes 40m with the impedance switch in both "Hi-Z" and "Lo-Z" with complete dimming of the LED. The reason I used the "Hi-Z" setting, tuning seemed easier, but mainly the noise (and signals) seemed noticeably louder with the "Hi-Z" setting and so I think it provides a better match with this particular total conductor length (radiating element plus counterpoise) over highly conductive ground.

The antenna works well on all bands. On 30m the total conductor length of this antenna is 1/2 wavelength. again the transmitter is connected at the 30% point along the 15 meter conductor. The radiating element is 0.35 wavelength long, the counterpoise is 0.15 wavelength long . On 30m, it will also tune in both "Hi-Z" and "Lo-Z" setting, but again "Hi-Z" seems to work best. On 20m the total conductor length is 0.70 wavelength. The radiating element is 0.50 wavelength long, the counterpoise is 0.2 wavelength long. On 20m I have only been able to get a match using the "Hi-Z" setting which makes sense. You have designed a miraculous radio. It is a blast to use!

This 15m (10.4m long antenna + 4.6m long insulated counterpoise) system is easy to deploy. If one is interested in low angle radiation it is easy to get the 34 ft part nearly vertical with an easy toss of a tether which will radiate well 40/30 and 20 meters. To go too much longer on 20m would spoil the low angle radiation properties I think.

A 34 foot wire will 1/4 wave on 40 so low impedance setting should be used.
On 20, it will be 1/2 wave so high impedance setting should be used there.

The problem with the keyer memory acting up is a firmware problem and can be fixed by letting me know you want to have it fixed. If so, we do a chip swap, where I send you a new chip and you send back the original for recycling.

Thanks to help from a couple members of the group I finally finished my pfr-3a. 5 watts out on all bands, got the matching paddle on it tonight.
I am amazed at the receiver.
If you are thinking about buying one quit thinkin and do it.

Im so giddy with happyness. (eh ehm!)
That MANLY giddy!

Topic: 1607 Message: 1627

I would be interested in it but I would need directions to install it into the PFR-3A specifically.
Does it fit in the case with the battery pack?
Can it work with out the led's if I just want to drill one hole?
is Dale, WC7S on this list?I would like to know a little more before I invest in it.
73, thank you in advance.
Rich NF8V.

Hi Rich,
The encoder doesn't fit into the Altoids tin with the ATS radios very well, but it would do well in PFR3 box and keep the same thickness. The leds could be not shown. It seems they may be left out, I'd like to check that to be sure. I'll be back in a couple days. It mounts between the main board and the front. During the build the overall thickness must be kept in mind, use of flushcuts and laying the caps flat is very helpful.

Steve,

Looks like a chip swap will be necessary. There is actually a "pop" in the headphones when the memory jumbles a letter. It will send the message correctly one time, then mess it up the next.

Please send the replacement chip to:

ARS WA9S
Keith Wishmeier
1834 Ribourde Drive
South Bend, IN 46628

574-243-6003
574-250-6992 cell

I'll return the original chip immediately. Thanks.

Keith

1631. Band resets periodically when tuning with the Up or Down buttons

Yahoo group: pfr3_group
Date: 2010-08-08 16:36:17 UTC
From: k9jri@att.net
Topic: 1631 Message: 1631

Sometimes when I am tuning around the band (usually 20M) the receiver will go quiet, the LED display will blank, then come back with "20" for a second and then return normal with the frequency tuned where I had been tuned.

The frequency does not return to the default frequency for the band so the power did not appear to have been interrupted. It appears as though the band was changed but the frequency does not return to default for that band.

Tapping on the cabinet does not cause the problem but either the Up or the Down button will.

It NEVER happens if I am not tuning Up or Down.

I have checked the solder connections on the right hand BAND switch as this tells the processor which band has been selected.

All of the board mounting screws appear to be tight.

It happens on both the internal battery pack and an external 12vdc. supply.

Any ideas where to look next would be appreciated.

Yes there is a fix. The problem should be with only orignal PFR-3's not the A version.

1. Make sure the 5V "cut and jump" mod has been done. The 5V from pin 7 of the MEGA48 (U6) should go to pin 20, not pin 21 as wired on the board.

2. Get your firmware updated. This will fix the random band changing and the message memory sending glitch.

Steve, thanks for the reply. Mine is a PFR-3A and is 2-3 months old. No other problems with its operation.

Another group member (WB6TNL) provided me with the target voltages at the bottom of R52. I have not opened the box to check those yet but I will soon. This was the data from his email to me:

"If yours is the 'a' model, first try re-seating the microprocessor in its socket. Then re-check the solder connections on the processor socket.

On either model, check the voltage at R52 (the end that doesn't have 5 Volts on it). This changes with the bandswitch selection. It must be as follows:

40: 2.5V
30: 1.5V
20: .20V (.22 in PFR3A)

If it is off then look for a resistor problem (R30, 31, 32) or bad solder connection in that area (Resistors, bandswitch).

If none of these things solve the problem then email Steve with the problem (he may respond to your posting anyway)."

Do you have any additional things that I should check while I am in the box Steve?

I have an early original PFR3. Love it. I too have noticed the band reset problem. It seems to be happening more frequently. I had the microcode updated and, as I recall, did the cut and jump mod.

All the files referencing the PFR3 are missing from the group website. I would like the check the mod.

From: Bill Trettin
Topic: 1631 Message: 1639

This was happening to me ever since I finished my PFR-3 and it was driving me crazy. My symptoms were close to yours but the PFR-3 would actually go to another band for a second or two. I'm not sure if I've fixed it or not but I haven't had it change bands on me since I found the problem although I haven't given it a good workout since then.

There's a capacitor in parallel with the three resistors which control the voltage drop on pin 24 of the microchip. In the instructions it's listed as C76, .01 ufd. On the schematic, it's shown as C62, .1 mfd (there's also another C62 in the LPF) and is right next to R30, R31 and R32. I checked C76 with an ohmmeter and it was open. I resoldered the connections and I haven't it had it change bands since.

Hope this helps.

Bill, HL9TY/KF8GE

Steve, and All,

I built my PFR-3 around the 2008 time frame and it has been in use everyday since. There can be a problem with "crud" getting into the "up" and "down" switches and others especially if you have grand kids around HI. I use a small brush and some 92% isopropyl alcohol and clean the switches every few months and that helps alot. I also use the "xyl's" hair dryer to dry the area and blow out any "crud". I would like to update the "firmware" ,however, I use the rig everyday and would miss the down time.

Bert M. Thompson KB3MHB/0 Hope this info helps. baby sitting the grand kids here in Denver 73

Steve, thanks for the reply. Mine is a PFR-3A and is 2-3 months old. No other problems with its operation.

Another group member (WB6TNL) provided me with the target voltages at the bottom of R52. I have not opened the box to check those yet but I will soon. This was the data from his email to me:

"If yours is the 'a' model, first try re-seating the microprocessor in its socket. Then re-check the solder connections on the processor socket.

On either model, check the voltage at R52 (the end that doesn't have 5 Volts on it). This changes with the bandswitch selection. It must be as follows:

40: 2.5V
30: 1.5V
20: .20V (.22 in PFR3A)

If it is off then look for a resistor problem (R30, 31, 32) or bad solder connection in that area (Resistors, bandswitch).

If none of these things solve the problem then email Steve with the problem (he may respond to your posting anyway)."

Do you have any additional things that I should check while I am in the box Steve?

Bert,

You won't have any down time (other than the time it takes to open and close your rig to swap chips); Steve Weber does the upgrade on an exchange basis. He will send you the updated chip on request and he trusts you to send him yours -after- you swap them.

Hi All,

I too have a problem with my original PFR3 with band resetting, but the biggest issue I have is I cannot send CW properly in A or B mode Iambic, the keyer randomly changes my dit paddle to a dah and vice versa, it makes it impossible to send anything. Is there anything I can do in the menu to resolve this? I get 5 watts on all bands and everything else seems to be ok.......I really want to use this rig in the field!

Cheers

Keith,

My guess is that you will need to get the firmware updated by Steve Webber. Just ask him. He will send you the updated chip. Then you send back the defective one. That is U7 on my PFR-3A. The exchange took care of my keyer problems on my 3A.

Digi-Key 8 conductor ribbon cable is available from $6.00 to $13.00 (or more) in 100 feet spools. That is where I bought mine a few years ago. I just looked and there is a whole page of them to choose from. Just go to Digi-Key and put in 8 conductor ribbon wire or cable in the search box.

Bob,

An other source ,but not ribbon cable, is the local hardware store. I used standard lamp cord and stripped it down to the correct length and stretched the ends out about 44 feet. At the center I attached a "tie wrap" to hang it. Then at the unstripped end I attached a "MFJ" 4 to 1 balun. Then attached about 25 feet of coax to my T1 tuner which is connected to my PFR-3. works great on 20, 30 and 40 meters.

Agree with Jake! Speaker wire works just fine. Used mine with my PFR3A while I was on vacation in Lake George, NY. Set it up as an inverted Vee and it worked well.

The built in tuner of the PFR3A had no trouble.

Hi Guys,

I made a doublet antenna, and parallel feed line, that works on all 3 band with the PFR-3. Material: two 75 ft long pc of 20 ga insulated wire. I used wire sold for underground dog fence. It comes in 500 ft spools, is flexible and tough HDPE UV resistant insulation. Only other material needed is a support tube and PVC electrical tape. No mechanical or soldered connections. Length not critical -- adjust doublet length to fit your portable QTH. I taped together 50 ft of TX line. The remaining wire makes a 50 ft (15m) long doublet.

No intentional air gap and no spacers for the feeder. Very adaptable, light and simple. PFR-3A loads easily with its BLT. Details and demonstration at:

http://www.youtube.com/user/NG9D and

http://ng9d.blogspot.com/2010/08/i-did-manage-to-build-antenna-later.html

1657. Question on Toroid winding

Yahoo group: pfr3_group
Date: 2010-08-23 14:50:06 UTC
From: Carey Magee (K2RNY)
Topic: 1657 Message: 1657

Hi All:

So far fo good on my PFR-3A build. All group tests pass with flying colors. What a thrill to work for a couple of evenings on the receiver section including winding my first ever toroid and then hooking everything up for the smoke test, turning the rig on and hearing a QSO in progress. Right off the bat.

My question is I noticed that I have been winding all my toroids CCW. Now that I am in the low-pass filter section, should I keep them all CCW or should I change to the more conventional CW for the 6 remaining in this section as well as the last real large one in the BLT section?

Thanks for your help.

Carey

From: Dwain Lawhon
Topic: 1662 Message: 1663

Mike:

I own one of the MFJ masts, and have been quite happy with it. I use it in the field to support a 88' long EDZ fed with ladder line. The ends of the EDZ are supported with 20' Crappie Fishing Poles that are readily available from the big sporting goods outfits (Bass Pro, Cabellas, etc) under different brand names. The tips of the poles are kinda flexible and bend under the antenna weight, but that's OK with me. It's like a fishing pole in that regard, it absorbs the energy of the load by bending with it. It also holds the ladder line away from the mast which I prefer.

I use emprovised ground stakes that I can easily push into the ground and that the poles will snuggly slip over to support the poles at the bottom. The stakes are something I made up in the work shop using pieces of wooden poles that you hang clothes on in the closet (about 1-3/4" OD). In the case of the MFJ pole I screw PVC end caps, as sleeves, on both ends of a 14" long wooden piece to fit the ID of the the MFJ mast at the bottom. (I have a lathe that I use to turn down 10" long wooden pieces to fit the smaller Crappie poles) I use very long nails (with heads cut off) driven into a predrilled hole in the bottom of the wooden pieces to make the ground stake for the 20' poles. The end of the nail is then sharpened to make it easy to push into the ground. For the MFJ , you need something a bit longer to push into the ground for support, so I use a long piece of 3/8" steel rod (about 14" going into the ground) instead of the shorter nails (which only go about 8" to 10" into the ground). The wood/PVC sleeve goes about 14" into the bottom of the MFJ pole.

I find these stake supports to be adequate in normal soil without using guys. They might not be sufficient for sand or very wet, loose soil where guys may be required. Anyway, this setup makes for a quick self-supporting antenna that's easy to erect.

You can use the masts to support various types of antennas. I have used them to put up inverted L's, inverted V's, end feds, regular dipoles, EDZs (used with a good antenna tuner for all bands), verticals, etc. I also found a small inexpensive plastic gun case at Bass Pro that will just accept the collapsed MFJ mast and I can get the 20' poles , ground stakes, spools of #26 wire, etc. in it for storage and transport. Not handy for back packing, but great for trunking and storage.

Sorry for the long winded explanation, but I do love working with the antennas.

Has anyone used the MFJ-1910 33' fiberglass mast?

If so what are your thoughts?

Dwain,

Thanks for the long reply. That is exactly the type of feedback I was looking for.

Do you find that he loss in the ladder line is noticably less that just using paired speaker wire? Which line do you use, the 1/2" (300 ohm) of the 1" (450 ohm)?

I am going to deploy the poles in a more permanent environment. My community does not have specific antenna restrictions but I do not want it to stick out like an electric sign. My plan is a 33' vertical for 40M & 30M and EFHW antennas for 20M, 17M & 15M. I already have a decent ground/radial system for the vertical. For 75M I will probably use a 75 to 90 foot wire extended off the top of the pole for the last 40 to 50 feet.

I want to be able to easily run the pole up and down to play with the antenna choice of the day.... so to speak. It will be used with a (Hendricks) PFR-3A, NADC-40, 17M & 15M Dual Bander, (Small Wonder Labs) PSK-40, PSK-20 or the new Retro-75.

I have no radios other than these kits at the present time.

Mike:

I have tried the twisted wire feed line and the ribbon cable feedline (aka Doug Hendricks antenna). Although they do work and can serve to lighten your pack load when in the field (I still have both in my aresnal of antennas), I have found that the 1" 450-ohm commercial ladder line is my first choice, if circumstance allows.

Sound like you are planning on putting up a lot of wire antennas when the BLT tuner in the PFR-3A will let you load a non-resonant dipole on all of the bands. I home build a Z-Match from notes off the internet and find that there is almost nothing that it won't load. Also, I found that the antenna tuners that Elecraft puts in their rigs work great. I would strongly recommend you invest in a good tuner to use with the rigs that don't have a built-in tuner. The small LDG tuner is also a nicely designed unit that seems to work well.

I have the 88' EDZ that I mentioned earlier in my attic here in Missouri and between the top of my 55' tower down to a tree at my home in Texas. They both use 1" 450-ohm feedline and I can load both of them on all bands with a good tuner. I have the K1, K2, K3, PFR-3, KX1, and quite a number of other QRP radios. I can use all of them on the EDZs. With the K3, I can load the EDZs from 80-m through 6-meters. I use the Elecraft 1:1/4:1 Balun at the radio output to gain a little leverage and then I can even load the one in Texas on 160-m. For some reason I cannot get the one in Missouri to load on 160-m. I haven't spent a lot of time trying to figure out why as it is relatively low to the ground and really too short to be a good 160-m antenna.

The reason I like the EDZ is you get gain as you go up in frequency. The 88' EDZ exhibits between 2-dB and 3-dB of gain at 20-m and just gets better as you go up in frequency. It also performs well on 40-m and 80-m although longer elements would help as you go down in frequency.

The nice thing about this antenna/tuner combo is that you don't have to have lots of different antennas in the air to work the different bands. Also, look at the radiation pattern. With two EDZs at right angles, and oriented properly, you can take advantage of the focused pattern and get very good coverage in the directions you want.

Friends of mine, George Baker (sk) W5YR and Bill Pierrard K5JHP, both use(d) two EDZs to contest (even though both had beams on towers). They also used separate antenna tuners on each of the feedlines running into the shacks. That way they could quickly switch from one to the other to select the one with the best signals during the heat of battle. Bill still ranks high in the Fox Hunt tests as did George when he was alive. Unfortunately I do not have the real-estate in Texas to allow me to put up two EDZs at right angles and I have

antenna restrictions at my home in Missouri so I am stuck with the attic antenna.

The collapseable masts/Crappie poles are really handy when doing antenna work. George, Bill, and I used to go out and play with antennas on the weekends. We would model them using EZNEC software and then make up tables of impedances that we could get out of the Elecraft antenna tuners in the various rigs. Those tuners use discrete L and C components, so you can put them together in various ways to get different impedances. Knowing the feedpoint impedance at the antenna, the length of the ladder line could be adjusted to transform the antenna feedpoint Z to get an impedance at the feedline input that could be matched by the tuners. We also had several different antenna analyzer instruments that allowed us to measure the complex impedance of the feedline input. It was all great fun. George was a true mentor and friend that really knew his stuff. I really miss him.

Mike, I hope all this helps you develop you antenna farm.

Dwain,

Again you provide more good stuff. Thanks for the comments on the 450 ladder line and I too would prefer that to the twisted pair that Hendricks described.

I think I was too brief with my antenna topic and left the wrong impression. I only intend to have a single antenna up at any one time. I must admit that I had not considered the EDZ but that is on my list now as well. The EFHW antennas are currently my favorite regarding space vs efficiency and I do have several tuners that would allow me to deploy the EFHW with coax feed into the shack.

I currently have the Elecraft T1, SGC-239, Hendricks BLT and MFJ-902. The BLT and 902 are manual but both have water tight outdoors enclosures (Tupperware).

Since I do want the ability to raise and lower the mast repeatably I may be better served with the 33' or the 43' MFJ heavy duty fiberglass masts with quick clamps.

I need to fall back and consider the horizontal EDZ versus the individual vertical EFHW antennas.

What would your thoughts be regarding the EDZ with its center at the top of the pole and the feedline (maybe 300 ohm) fed down the inside of the pole to an autotuner at the base of the pole. Coax from there to the shack.... about 50 feet away. One end of the ED would be easily lost in the trees but I am not sure how to hide the other end yet.

Very 73 - Mike - K9JRI

1667. PFR-3 and PSK?

Yahoo group: pfr3_group
Date: 2010-08-25 03:35:00 UTC
From: ribu947
Topic: 1667 Message: 1667

I am brand new to this and am about to purchase my first transceiver... the pfr-3. I assume that the PFR-3 can work with PocketDigi and perform PSK comms. Am I correct? Anyone with experience? I understand that the ATS-3 can do this and I thought the PFR-3 was based on the same platform. Thanks for any help. I look forward to talking with you folks!

I have one of these and it has served me very well. Most of the time i have used it to support a 40m dipole hung as an inverted vee. I taped the joints and taped the coax to the pole. The wires of the inverted vee then act as guys. The center insulator would be taped to the pole about
18 inches down from the top.

Also used the pole to support a vertical ground plane. My getting the base of the pole extended a couple of feet, it will take a full 1/4 wave 40 meter vertical. For 30 m the base is off the ground several feet allowing for four elevated radials.

A piece of 2 inch diameter PVC will slide over the pole and will protect the base section and any clamping is not harmful. I use a fence stake with two blocks of wood bolted to it and a U-clamp thru the wood blocks and around the PVC protecting the base section.

Drive the stake in the ground etc etc and my inverted vee is in place in less than five minutes.

With the PFR3, a 34 foot wire with a 15 ft countepoise should cover all three bands.

My MFJ pole is at least five years old and it has been deployed well over 100 times as I enjoy field ops.

Hope this helps

From: Dwain Lawhon
Topic: 1662 Message: 1671

Mike:

I have no problem with the basic concept, except for the problem of getting the mast to collapse with the feedline inside it. The 1" ladder line can get kinda stiff when confined. Also, the MFJ 33' collapseable mast that I use gets relatively small near the top. It's really just an extra long version of the Crappie fishing poles that you see discussed so much. The top section has an eyelet just like you would expect on a fishing pole and is small and flexible being less than 1/4" where it enters the section below it. The 1" feedline wouldn't fit inside it. For field work, I like the Crappie Pole design and have had no problems with it. I'm not sure what the problems were that caused so many poor reviews to be written up on it.

If you want to go stealthy with the antenna, the flag pole idea that is kicked around and used by some might be worth your consideration. The larger MFJ mast would have a larger I.D., possibly making it easier to accomodate the ladder line and, since you might want to leave the antenna up most of the time, would be more robust. I would not be too concerned about metal clamps or sleeves as long as there's not a lot of movement going on between the feedline and the metal parts. I have ladder line that is near my furnace and ductwork in my basement and have had no problem with tuning and feeding it. Of course, it is stationary hence, once tuned, doesn't change. I have also run ladder line thru metal window casement without problems as well.

The tuners you own are excellent units and will serve you well. Placing the SGC at the base of the mast would work nicely. I don't know what your layout looks like, but if you could use the ladder line from the antenna all the way to the outside wall of the house/shack, there would be less loss than incurred with coax. Unfortunately, the ladder line would be highly visible hanging out, so-to-speak, and awkward to support if the span is great. Also, not very stealthy.

Have you considered using a "bead type balun" at the point where you transition from ladder line to coax? Then you could use the tuner in your shack to match the Z at the input to the coax to the transmitter output Z. This would eliminate having the tuner at the base of the antenna along with a lot of control wiring. I have not used this technique at my locations since I have the ladder line run all the way to my operating position, but I have seen it done successfully by others.

Enough of my rambling. Hope some of this helps.

Subject: [pfr3_group] Re: MFJ-1910

Dwain,

Again you provide more good stuff. Thanks for the comments on the 450 ladder line and I too would prefer that to the twisted pair that Hendricks described.

I think I was too brief with my antenna topic and left the wrong impression. I only intend to have a single antenna up at any one time. I must admit that I had not considered the EDZ but that is on my list now as well. The EFHW antennas are currently my favorite regarding space vs efficiency and I do have several tuners that would allow me to deploy the EFHW with coax feed into the shack.

I currently have the Elecraft T1, SGC-239, Hendricks BLT and MFJ-902. The BLT and 902 are manual but both have water tight outdoors enclosures (Tupperware).

Since I do want the ability to raise and lower the mast repeatably I may be better served with the 33' or the 43' MFJ heavy duty fiberglass masts with quick clamps.

I need to fall back and consider the horizontal EDZ versus the individual vertical EFHW antennas.

What would your thoughts be regarding the EDZ with its center at the top of the pole and the feedline (maybe 300 ohm) fed down the inside of the pole to an autotuner at the base of the pole. Coax from there to the shack.... about 50 feet away. One end of the ED would be easily lost in the trees but I am not sure how to hide the other end yet.

I have downloaded the -b version of the manual from here. My questions are these:
1. Does this have all of the mods that people have done which led to the pfr-3a to be designed
2. Can the chip still be upgraded if it is one of the ones without the red dot?
3. In the -b manual does it have the toroid changes for the blt?
4. what am I missing or forgetting to ask? Are there mods that everyone knows about but aren't really in the documentation?

1.) Do you have a PFR-3(no suffix) kit? If so, then the latest manual for that radio is the 'B.2' rev. dated Sept. 22, 2008. It is not in the 'Files' section.

2.) If a PFR-3(no suffix), yes.

3.) I am not certain. Use the 'B.2' manual.

4.) The only mod. I'm aware of that is printed in the manual is the 'cut-and-jump' mod.

Dwain, from all I have learned, from you and others on other QRP forums, it looks like I might be better served with the much more expensive MFJ-1908H. The top section is large enough that I can get a small feedline through it, certainly with the top section omitted.

It also appears to be much better suited to being extended and collapsed on a regular basis. I looked at the S9 antenna earlier today but it too is very small at the top, quite flexible in even a modest wind and because it uses screws to secure each section does not appear to be ideal for my purposes.

Thanks again Dwain and all of you who have responded.

From: Lee Mairs (SAG)
Topic: 1672 Message: 1675

I bought an early version PFR-3 kit from DOug. I also would like the same information or a point to a URL that contains the info.

I just gotta get started on these kits earlier. You can't believe the size of my unbuilt kit queue.

Subject: [pfr3_group] Re: MFJ-1910

Dwain, from all I have learned, from you and others on other QRP forums, it looks like I might be better served with the much more expensive MFJ-1908H. The top section is large enough that I can get a small feedline through it, certainly with the top section omitted.

It also appears to be much better suited to being extended and collapsed on a regular basis. I looked at the S9 antenna earlier today but it too is very small at the top, quite flexible in even a modest wind and because it uses screws to secure each section does not appear to be ideal for my purposes.

Thanks again Dwain and all of you who have responded.

Yes it is the no suffix model. Where might one find the b.2 version if not in the files section?

Thanks Steve -
I got the manual just fine. Now I need to figure out the differences
between the early version and the B version.

Has it ever worked.. or is the first time? Is the sense lead connected to 12v, and the neg connected to the ground of the board? Is this mounted in the case of the PFR3? Did it pass the set up test?
and yes... if any of the above is optional, then the correct operation of the BSI is optional.

Never worked (I just finished building it)
Senses lead all connected OK.
Not mounted in the case but its the plan so I choose the case switch.
Not passed the setup test.

Also, I think the led mounted ok, understanding the notch (the squared leg) is on the edge side.

Well....

Do you have a voltmeter to use for measuring the input voltage? I used a 9v battery to test the first time on mine. That way I didn't have any issues with polarity, or overvoltage/undervoltgage, and I could set the low side up quick.
Maybe a close look at the soldering, just for insurance would be good too. Yep, the notch goes to the edge of the board.
We'll get it.

Yes my power source is 13V.

I'll recheck slowly the solderings.

THanks anyways

Can't beat that 9V battery. It's much safer in case of a screw up! You'll love the PFR-3A when you get it done. I have 34 states and about a half dozen countries in 2 1/2 weeks using all three bands.

Do you have positive voltage applied to the input, and the negative tied to the ground side?
Is there voltage on the IC?
What does the ic measure for volts?
You can sure use a 9v battery for testing too...
I had one that didn't want to work.. checked and rechecked everything.... then I found the input to the BSI was wired to the off position of the PFR3 radio. It only worked when the radio was off. Not the way I was testing it.
Yes, I know.. the PFR3 doesn't have an off.... until there isn't a battery inside... then that is off.
I changed it to the radio side.. so the BSI would measure either one, internal or external supply.. and it worked fine then.
Good Luck,

Hi,
The main difference between the two, is a change in the microP that fixes a glitch in cw at the beginning of tx. if I remember correctly, Steve will send a new chip if you get in touch with him. The other difference is the case.. the later one has decals, not painted on labels.
Have a great day, they are wonderful fun radios, either one.

1695. Re: Band resets periodically when tuning with the Up or Down buttons

Yahoo group: pfr3_group
Date: 2010-08-31 11:22:39 UTC
From: k9jri@att.net
Topic: 1631 Message: 1695

After watching the PFR-3A for a while longer I believe that the only time the band resets is when I am on 20M. Even then it is quite random and only when a tune button is being used.

The voltage at the bottom of R52 measures .212 vdc where the target is .220 vdc. I may change R52 to see what happens with the voltage closer to .220.

Since the other bands seem to be stable this would seem to be a good place to look.

Mike,

I would not recommend changing the value of R52 -unless- the voltages are incorrect on all bands -and- in the same 'direction' (low). If the divider voltage is OK on 40 and 30 then I would recommend adjusting the value of R30.

I don't know how critical these voltages are. It would be interesting to know their limits.

Steve,

I had to go back and re-read my original post after I returned home from the shooting range :) R30 is certainly the correct resistor and was the resistorI originally intended but I apparently failed to tell my typing fingers :)

Measure at the bottom of R52 but replace R30 to correct the voltage.

Sorry - bout - that :)

---------- Original Message ----------
Steve,

I had to go back and re-read my original post after I returned home from the shooting range :) R30 is certainly the correct resistor and was the resistor I originally intended but I apparently failed to tell my typing fingers :)

Measure at the bottom of R52 but replace R30 to correct the voltage.

Sorry - bout - that :)

1700. Decals

Yahoo group: pfr3_group
Date: 2010-09-04 20:02:23 UTC
From: Andrew
Topic: 1700 Message: 1700

Hello All,

Did my first SOTA activation on the Island of Skye (SI-004)on Friday using a fishing pole 40m dipole and the PRF3 great fun.

SOTA info for anyone that is interested

http://www.sotawatch.org/

which the PRF3 is well suited for.

So question does anybody in the UK have any a complete set of decals spare due to me making a complete mess of them.

Thanks

Andrew GM0UDL

Hi Andrew,

Just worked Scotland on 18MHz. http://www.youtube.com/user/NG9D#p/u/12/nEKBmaBeUJc
Fun with 49m of 20 gauge wire in the trees! Maybe there is hope for cycle 24? By the way, nice antenna farm you have Andrew!!

1702. RC Car battery pack

Yahoo group: pfr3_group
Date: 2010-09-06 01:32:15 UTC
From: k6mgo@verizon.net
Topic: 1702 Message: 1702

Was wondering if anyone has installed the RC Car battery packs, NiMH 9.6 V, 2200 mH, with the welded tabs, rather than the supplied spring loaded battery case?
Reason I ask, is I had an FT-817nd with the internal battery case, and at 5 watts out, there was almost a 2 volt drop across the battery case. The welded tabs work so much better, you get more of your battery voltage to the rig.

Bill, k6mgo

1703. RE: [pfr3_group] RC Car battery pack

Yahoo group: pfr3_group
Date: 2010-09-06 01:38:37 UTC
From: Dale Putnam
Topic: 1702 Message: 1703

I've had good luck with both types of batteries, however, the welded tab batteries will, over the long run, deliver better in a high vibrations environment. I have had the spring loaded battery cases fail with hi internal resistances, usually caused by foreign material, or simply loose contacts.
I found mine in the bargain corner at the local RS store. Got the batteries and a charger for four bucks.

From: Rich
Topic: 1702 Message: 1704

I took the internal packs out..... I'm using a alarm system battery externally. Im plug it into the external power pack. lasts for days.

I wonder if using RC parts classify it as a mobile ? That's quite the power plant your using. I wonder what it will look like with wheels. ooohhh!

I don't think you can use a key while
in motion though. So now we need 6 meters and a pilot to stay legal.

Didn't purchase from Hendricks. Does anyone know the specs off hand? What size and voltage?

1706. Re: Band resets periodically when tuning with the Up or Down buttons

Yahoo group: pfr3_group
Date: 2010-09-09 10:54:55 UTC
From: k9jri@att.net
Topic: 1631 Message: 1706

Some additional observations further cloud the issue. I did have the brief reset happen once on 30M yesterday somewhat removing the value of R30 from the list of suspects. What I have noticed is an apparent "interrupt" or suspension of processing that occurs at seemingly random times. It reminds me very much of the old Microsoft Basic memory cleanup routine that would occur periodically.

What I noticed was that when sending a long 3x3 CQ from memory that one of the characters would be randomly garbled. Not on every CQ and seldom on the same character but nonetheless a random computer glitch that somewhat matches the frequency reset issue. The same in that it is only apparent if you have asked the processor to do something (send from memory or change frequency) and quite random in its timing.

I am not at all familiar with the PIC devices. Do they in fact have periodic "house cleaning" routines like the old "Microsoft Basic" had?

Hi PFR-3 group. I received my new kit on Wednesday and finished it and made my 1st qso with it on Friday evening. Wonderful radio! I am looking forward to using it for a long time to come. Your experiences and comments here have been instrumental in helping me make the decision to buy or not. Thanks to all. 72 de KF6U.

Not sure but Like any early model rig,even commercial rigs you bound to find some problems but with these simple rigs they can be corrected very easy and you have the support on the list here.
BTW,
You your post came in with a full page of headers.

Not sure what happened because your message was way down at the bottom. Looks like Yahoo barfed up on your post. How do you like the rig? I watched a video and it looks a bit large in size. I had the China 3 band rig but as soon as you started sending on 20 meters power dropped off. So I went for the tt 2 band rig and that just is nothing but the HB1A rig with 30 disabled and it is being sold with some wrong parts but TT will not refund. But they both have one big display. I may go for the 3 band El craft and pay someone to build it up as my soldering days are over. Bob. AF2Q

someone is selling a pfr3 on qth.com
hes asking $300
im into building things and still have a lab so i can easily repair and tune up ham radio and test equipment.
im no tentec fan and have a 20 m tt rig that i have to repair "came smoked but i have most of the parts to repair it "im mostly on 40 m ssb phone"
i dont any qrp rig at the present time except the ten tec that from what i read is junk i did build up a emtech sw40 which i used caseless for a while on my shack bench.
i gave it to a fellow ham who i owed a favor to and he uses it caseless to listen to 40 m transmissions "both ssb and cw"
i believe hendricks is using cases from tentec "they are very good cases"
what was the power level on the 20m cw band using the chinese rig.
i have the emtech tuner which is similar to the hendricks stand alone
and the one built into the pfr3. the pfr3 tuner probably has more compensation range then the elecraft ones from one i read most hams use some sort of external tuner with their rigs.
i like the elecrafts use of subminiture latching relays.
a qrp rig has to be able to tune up a metal bedframe can the kx1 tuner do that
my little emtech can maybe the pfr3 can too
the kx1 fully loaded is a $500 kit "i dont think its worth it"
i believe the pfr3 is an easier build then the elecraft
i read a post that someone is offering prewound toroids for the pfr3.
winding toroids has never been a problem for me.
i believe if you properly wire up a pfr3 the rig should work well when its first powered up.
i dont believe the elecraft is much of a short wave receiver.
i wonder if the pfr3 could be made to receive ssb
i have done this when band conditions were down received ssb and answered using cw "it worked"
remember cw is legal on any ham band regardless of band segment.
"gentlemans agrements " just like lsb below 9 mhz and usb above 9 mhz
the military only uses usb for voice and much surplus military equipment is usb only for voice
i think they use/used lsb for data "mostly rtty"
im planning to sell off some excess ham gear and test equipment and then maybe i will treat myself to a nice qrp rig .

i was just looking at the schematic of the tentec 40/20 rig
the transmitter uses a bipolar output transistor and im sure its quite swr sensitive.
its a very simple design and im not sure how good its variable bandwidth
if filter is "its digitally controlled"
i started in 1969 at age 12 with a heath hw16 cw only transceive that my late father and i built. fount out from other novice hams that i had a much better rig then they did.
they talk about variable selectivity but the shape of the filter might be horrible when you open it up "the emtech is variable selectivity and it needed an audio filter to really be sharp from what i here the pfr3 dosent
i watched a video on you tube and it was sharp with no ringing.
elecraft has had allot of problems with their ssb rigs design and its not simple to align
"the pros use a spectrum analyzer with a tracking generator"
"i have an older tek spectrum analyzer but no tracking generator"

im into building things and still have a lab so i can easily repair and tune up ham radio and test equipment.
im no tentec fan and have a 20 m tt rig that i have to repair "came smoked but i have most of the parts to repair it "im mostly on 40 m ssb phone"
i dont any qrp rig at the present time except the ten tec that from what i read is junk i did build up a emtech sw40 which i used caseless for a while on my shack bench.
i gave it to a fellow ham who i owed a favor to and he uses it caseless to listen to 40 m transmissions "both ssb and cw"
i believe hendricks is using cases from tentec "they are very good cases"
what was the power level on the 20m cw band using the chinese rig.
i have the emtech tuner which is similar to the hendricks stand alone
and the one built into the pfr3. the pfr3 tuner probably has more compensation range then the elecraft ones from one i read most hams use some sort of external tuner with their rigs.
i like the elecrafts use of subminiture latching relays.
a qrp rig has to be able to tune up a metal bedframe can the kx1 tuner do that
my little emtech can maybe the pfr3 can too
the kx1 fully loaded is a $500 kit "i dont think its worth it"
i believe the pfr3 is an easier build then the elecraft
i read a post that someone is offering prewound toroids for the pfr3.
winding toroids has never been a problem for me.
i believe if you properly wire up a pfr3 the rig should work well when its first powered up.

i dont believe the elecraft is much of a short wave receiver.
i wonder if the pfr3 could be made to receive ssb
i have done this when band conditions were down received ssb and answered using cw "it worked"
remember cw is legal on any ham band regardless of band segment.
"gentlemans agrements " just like lsb below 9 mhz and usb above 9 mhz
the military only uses usb for voice and much surplus military equipment is usb only for voice
i think they use/used lsb for data "mostly rtty"
im planning to sell off some excess ham gear and test equipment and then maybe i will treat myself to a nice qrp rig .

Not sure what happened because your message was way down at the bottom. Looks like Yahoo barfed up on your post. How do you like the rig? I watched a video and it looks a bit large in size. I had the China 3 band rig but as soon as you started sending on 20 meters power dropped off. So I went for the tt 2 band rig and that just is nothing but the HB1A rig with 30 disabled and it is being sold with some wrong parts but TT will not refund. But they both have one big display. I may go for the 3 band El craft and pay someone to build it up as my soldering days are over. Bob. AF2Q

As a lot of you guys who have built this rig already know, it receives on the upper sideband on 40, and the lower sideband on 20m. So don't plan on even casual reception of SSB (filter would be too narrow for than anyway).

The PFR-3 is a very good QRP CW transceiver that produces a full 5W on three bands and has a built-in tuner that matches wide range of antenna impedances. But In my opinion, the main reason the PFR 3 is a better deal that the Chinese HB-1A is that it is a KIT!

If you enjoy kit building and QRP CW, you will DEFINITELY not be disappointed Weber/Hendricks field radio!

Topic: 1709 Message: 1719

The main difference between the early and later kits is the glitch in the keying...Some time back Steve offered to exchange the glitches chip for a new one...if you would kindly send the old one back...very generous on Steve's part! The other difference goes to estetics in the first one the case was painted on labels, the later had decals, either look fine, if applied properly. Clear kote does it nicely for both. The radios come out nicely. I have built a number of both of them, either exceed specs. So if you might use a cw rig, nicely packaged and internally battery powered, jump on or just order a PFR3. If you are a vet or disabled building can be had easily.
Oh...and for those that have to have meters wiggle full scale....use the lower scale on your watt meter....that may be the only way you really find out this. is a qrp rig.

what was the power level on the 20m cw band using the chinese rig.
i have the emtech tuner which is similar to the hendricks stand alone
and the one built into the pfr3. the pfr3 tuner probably has more compensation range then the elecraft ones from one i read most hams use some sort of external tuner with their rigs.
i like the elecrafts use of subminiture latching relays.
a qrp rig has to be able to tune up a metal bedframe can the kx1 tuner do that
my little emtech can maybe the pfr3 can too
the kx1 fully loaded is a $500 kit "i dont think its worth it"
i believe the pfr3 is an easier build then the elecraft
i read a post that someone is offering prewound toroids for the pfr3.
winding toroids has never been a problem for me.
i believe if you properly wire up a pfr3 the rig should work well when its first powered up.
i dont believe the elecraft is much of a short wave receiver.
i wonder if the pfr3 could be made to receive ssb
i have done this when band conditions were down received ssb and answered using cw "it worked"
remember cw is legal on any ham band regardless of band segment.
"gentlemans agrements " just like lsb below 9 mhz and usb above 9 mhz
the military only uses usb for voice and much surplus military equipment is usb only for

voice
i think they use/used lsb for data "mostly rtty"
im planning to sell off some excess ham gear and test equipment and then maybe i will treat myself to a nice qrp rig .

Not sure what happened because your message was way down at the bottom. Looks like Yahoo barfed up on your post. How do you like the rig? I watched a video and it looks a bit large in size. I had the China 3 band rig but as soon as you started sending on 20 meters power dropped off. So I went for the tt 2 band rig and that just is nothing but the HB1A rig with 30 disabled and it is being sold with some wrong parts but TT will not refund. But they both have one big display. I may go for the 3 band El craft and pay someone to build it up as my soldering days are over. Bob. AF2Q

Not sure but Like any early model rig,even commercial rigs you bound to find some problems but with these simple rigs they can be corrected very easy and you have the support on the list here.
BTW,
You your post came in with a full page of headers.

I find that a rather interesting comment Bob. It has been my experience that Icom, Yaesu and Kenwood have many defects that you are never made aware of and are fixed on a later version of the rig.... all at your expense.

I think the kits are well designed and the after sales support is excellent. After all it is an ELECTRONICS hobby and fussing with the equipment is most of the fun.

I have several Hendrick's kits (PFR-3A, BitX20A, NADC-40, Weber Dual Bander, dummy load) and none were perfect. They were less troublesome than my IC-718, IC-706, IC-706MKII and IC-706 MKIIG though and I have been able to correct issues myself.

In general QRP is not a "Store Bought" phase of a very diverse hobby.

Oh yes, in the "old days" I built over 40 Heathkit rigs and all required some type of follow-up work or self designed modification. It would have been quite boring without any problems.

The main difference between the early and later kits is the glitch in the keying...Some time back Steve offered to exchange the glitches chip for a new one...if you would kindly send the old one back...very generous on Steve's part! The other difference goes to estetics in the first one the case was painted on labels, the later had decals, either look fine, if applied properly. Clear kote does it nicely for both. The radios come out nicely. I have built a number of both of them, either exceed specs. So if you might use a cw rig, nicely packaged and internally battery powered, jump on or just order a PFR3. If you are a vet or disabled building can be had easily.
Oh...and for those that have to have meters wiggle full scale....use the lower scale on your watt meter....that may be the only way you really find out this. is a qrp rig.

As a lot of you guys who have built this rig already know, it receives on the upper sideband on 40, and the lower sideband on 20m. So don't plan on even casual reception of SSB (filter would be too narrow for than anyway).

The PFR-3 is a very good QRP CW transceiver that produces a full 5W on three bands and has a built-in tuner that matches wide range of antenna impedances. But In my opinion, the main reason the PFR 3 is a better deal that the Chinese HB-1A is that it is a KIT!

If you enjoy kit building and QRP CW, you will DEFINITELY not be disappointed Weber/Hendricks field radio!

You are wrong because I said several times that even commercial built rigs are full of problems. However when a person designs a rig and sells it on the market with a known issue,that isn't right. The first run of the china rig wasn't to bad because the kits had through hole parts that most were able to replace. Now TT has the 2 band rig with 30 meters disabled but still using some of the parts that should not be in that rig. Some hams yelled loud enough and received a refund. However kits like the older SST and the NC-20 after so many years never put out a kit with parts to correct the problems they had but the SWxx kits Dave Benson sells seems to be bug free and does just what it's supposed to do. I can't speak for the pfr-3 because I never even saw one but I have read many post about the problems but most were issues with the tuner. Bob AF2Q

Bob, While this was not directed to me I should clarify my previous post. My Bitx20A, NADC-40, PFR-3A and Weber Dual Bander all worked fine on the first try. I did not consider them 100% as there were some documentation errors that I was able to avoid by comparison to the schematics, as well as some incorrect parts received that were replaced from my parts bins and alignment procedures that I did not find too clear.

There are also features that I would have changed and circuits that I have modified but all worked well on the first shot.

I believe than some kits do not work as a result of the lack of experience on the part of the builder in reading a schematic and/or understanding how the circuit should work. Many testing questions have been posted that would not have been an issue if the person had any basic trouble shooting skills.

Experience can only be gained by getting in there and learning through successes and mistakes. The problems encountered are not necessarily a fault of the kit as much as a mismatch between the complexity of the kit and the knowledge and experience level of the builder.

The Ten Tec's that you mentioned are not kits and I agree that they should not have obvious issues which they seem to have.

I am not trying to be defensive or judgmental but most of the problems you see on the groups are user/builder issues more than kit issues. Fewer people sign up for the groups that are 100% happy and have no questions than those that have encountered problems and are seeking trouble shooting assistance. This somewhat distort the issue of quality.

Very 73 Bob from Mike - K9JRI

It's pretty darn easy to replace the chip. Just unplug it. That fixed the keying issue. Heck I started building Heathkits in the 60's and even they had an occasional component defect.
These are basically hand assembled kits by a small ham-oriented operation with incredible follow-up throughout the assembly procedure. My PFR-3A has become my favorite radio in the shack as well as out in the field. And I am comparing it to my Yaesu FT-817, FT-747, TenTec Omni Vi+, Heath SB-104, Heath SB-201 and Heath HW-8!

I had the China 3 band rig but as soon as you started sending on 20 meters power dropped off. So I went for the tt 2 band rig and that just is nothing but the HB1A rig with 30 disabled and it is being sold with some wrong parts but TT will not refund. But they both have one big display. I may go for the 3 band El craft and pay someone to build it up as my soldering days are over. Bob. AF2Q

Typo correction. That is a Heathkit SB-102, not 201. Of course I also have the SB-200 linear. Been at this hobby 50 years!

The main difference between the early and later kits is the glitch in the keying...Some time back Steve offered to exchange the glitches chip for a new one...if you would kindly send the old one back...very generous on Steve's part! The other difference goes to estetics in the first one the case was painted on labels, the later had decals, either look fine, if applied properly. Clear kote does it nicely for both. The radios come out nicely. I have built a number of both of them, either exceed specs. So if you might use a cw rig, nicely packaged and internally battery powered, jump on or just order a PFR3. If you are a

vet or disabled building can be had easily.
Oh...and for those that have to have meters wiggle full scale....use the lower scale on your watt meter....that may be the only way you really find out this. is a qrp rig.

As a lot of you guys who have built this rig already know, it receives on the upper sideband on 40, and the lower sideband on 20m. So don't plan on even casual reception of SSB (filter would be too narrow for than anyway).

The PFR-3 is a very good QRP CW transceiver that produces a full 5W on three bands and has a built-in tuner that matches wide range of antenna impedances. But In my opinion, the main reason the PFR 3 is a better deal that the Chinese HB-1A is that it is a KIT!

If you enjoy kit building and QRP CW, you will DEFINITELY not be disappointed Weber/Hendricks field radio!

Subject: Re: [pfr3_group] pfr3 kits

someone is selling a pfr3 on qth.com
hes asking $300
im into building things and still have a lab so i can easily repair and tune up ham radio and test equipment.
im no tentec fan and have a 20 m tt rig that i have to repair "came smoked but i have most of the parts to repair it "im mostly on 40 m ssb phone"
i dont any qrp rig at the present time except the ten tec that from what i read is junk i did build up a emtech sw40 which i used caseless for a while on my shack bench.
i gave it to a fellow ham who i owed a favor to and he uses it caseless to listen to 40 m transmissions "both ssb and cw"
i believe hendricks is using cases from tentec "they are very good cases"
what was the power level on the 20m cw band using the chinese rig.
i have the emtech tuner which is similar to the hendricks stand alone
and the one built into the pfr3. the pfr3 tuner probably has more compensation range then the elecraft ones from one i read most hams use some sort of external tuner with their rigs.
i like the elecrafts use of subminiture latching relays.
a qrp rig has to be able to tune up a metal bedframe can the kx1 tuner do that
my little emtech can maybe the pfr3 can too
the kx1 fully loaded is a $500 kit "i dont think its worth it"
i believe the pfr3 is an easier build then the elecraft

i read a post that someone is offering prewound toroids for the pfr3.
winding toroids has never been a problem for me.
i believe if you properly wire up a pfr3 the rig should work well when its first powered up.
i dont believe the elecraft is much of a short wave receiver.
i wonder if the pfr3 could be made to receive ssb
i have done this when band conditions were down received ssb and answered using cw "it worked"
remember cw is legal on any ham band regardless of band segment.
"gentlemans agrements " just like lsb below 9 mhz and usb above 9 mhz
the military only uses usb for voice and much surplus military equipment is usb only for voice
i think they use/used lsb for data "mostly rtty"
im planning to sell off some excess ham gear and test equipment and then maybe i will treat myself to a nice qrp rig .

Hi Bob,

In my earlier post I meant to say I had the version "A" kit: PFR-3A, and I don't have any complaints with its operation.

If you would like to see one demonstrated on all three bands 40, 30 and 20m, with several different types of antennas (coax fed loop, end fed wire and parallel wire fed doublet) see http://www.youtube.com/user/NG9D

These videos also show the assembly process from taking inventory, building the receiver through transmitter assembly and testing. All the tiny SMD (Surface Mount Device) parts come pre-assembled. The rest of the kit is very easy to assemble. The videos are the best way I know how to show you what a super little rig this is.

If you are a CW operator who also enjoys building kits, I am pretty sure you would appreciate both building and using it! The PFR-3A for its set of unique features that I don't think is exactly matched by any "store-bought" QRP transceiver. The wide impedance range tuner is one of its best attributes, in my opinion. Try one, I'm sure you will like it!!

Hi lynn, I never had that rig and never even knew there was a newer version. My gripes (and they should not be on this list) are about the Ten Tec dual band being sold,built with known issues. As far as building one now would be difficult for me due to a small stroke about 3 years ago so soldering for me is now history except for some small items like the PICO keyer. I did get the NE/scaf filter but had to get another person to put that together for me. I have dial up but later will watch that video. Thanks for responding. 72 Bob AF2Q Sent By the AF2Q PHONE

Topic: 1709 Message: 1732

Hi Bob, and group,
I really have a problem when circuits that aren't correct... aren't corrected until the customer gets the problem in hand... then is expected to make the correction. That hasn't happened with either the AT radios, or the Doug Hendricks radios, specifically, the ATII, III, 3 or 3b1 or the PRF3a or 3b, as previously noted.
My offer to the vets or or those that can't, still stands, you buy, I'll build it. No problem.. you're out the cost of shipping. I'll garuntee the radio to meet or exceed published specs, and I provide a spec sheet stating so... with traceablility directly to the National Bureau of Standards - Boulder.
I have never had one of the radios not meet specs. Have had one do DXCC already, on a long wire antenna, and a number of them are being used in the Fox and Coon Hunts.
It is pretty reasonable that negative comments are held for those radios that I have had direct experience with... therefore, it stops here.
Oh.. and one thing more.. if you built one of the radios that are mentioned above, and either can't get it to work, or would like it optimized, I will make it work and also do the specs. The warrenty may be shortend a bit from the year or more. This is not in any fashion to be considered competitive to either Steve Weber or Doug Hendricks repair efforts. They do quite a nice job.

Now, back to makin smoke,
Have a great day,

--... ...-- Dale - WC7S in Wy

a common problem issue are toroids wound with the wrong number of turns
, wrong wire gage, bad soldering of the enameled wire, windings out of phase too.

Subject: [pfr3_group] Re: pfr3 kits

Bob, While this was not directed to me I should clarify my previous post. My Bitx20A, NADC-40, PFR-3A and Weber Dual Bander all worked fine on the first try. I did not consider them 100% as there were some documentation errors that I was able to avoid by comparison to the schematics, as well as some incorrect parts received that were replaced from my parts bins and alignment procedures that I did not find too clear.

There are also features that I would have changed and circuits that I have modified but all worked well on the first shot.

I believe than some kits do not work as a result of the lack of experience on the part of the builder in reading a schematic and/or understanding how the circuit should work. Many testing questions have been posted that would not have been an issue if the person had any basic trouble shooting skills.

Experience can only be gained by getting in there and learning through successes and mistakes. The problems encountered are not necessarily a fault of the kit as much as a mismatch between the complexity of the kit and the knowledge and experience level of the builder.

The Ten Tec's that you mentioned are not kits and I agree that they should not have obvious issues which they seem to have.

I am not trying to be defensive or judgmental but most of the problems you see on the groups are user/builder issues more than kit issues. Fewer people sign up for the groups that are 100% happy and have no questions than those that have encountered problems and are seeking trouble shooting assistance. This somewhat distort the issue of quality.

Very 73 Bob from Mike - K9JRI

From: arthur
Topic: 1734 Message: 1734

has anyone compared the pfr3 to others in its class like
the k1, and kx1 .
the pfr3 has an unusual transmitter circuit.
its actually similar to my hp 8640 b signal generator.
"square waves low pass filtered to sine waves"
"ive never seen it done before in a ham rig"
he says spurious is 50 db down too.
thats how he is able to generate 5 watts with 3 little mosfets in parallel.
the ten tec rig lifted allot of techniques from us
"typical chinese approach"

I used a KX-1 for about six months and for the most part was not satisfied. My primary gripe was that it was almost a double sideband receiver. On signals of moderate strength or higher I could always hear the other sideband. Also narrowing the filter changed the "S" meter readings. Changing keyer speeds was a bit time consuming. The side mounted paddle was of the capacity touch type which I was not able to get used to.

On the other hand, it was nice that it could receive sideband very well as well as zero beat AM stations. Also the automatic antenna tuner was great. Except for the occasional band "jump" and return, my PFR-3A performs perfectly. The manual tuner will tune anything with a little patience and practice. Changing keyer speed is a snap while on the fly. Receiver filtering is excellent. General operation is quite intuitive. I enjoyed building it!

I have not used the Elecraft but I do own both The PFR-3A and the Weber Dual Bander. These two rigs share almost identical designs.

I looked at the Elecraft KX1's design in pretty good detail prior to making the decision to purchase the Weber designed PFR-3A and then the Weber Dual Bander for 17M & 15M.

My reasons were as follows:

1. The KX1 and the PFR-3A receivers are quite similar in design but the PFR-3A has a double tuned front end while the KX1is single tuned.

2. The PFR-3a has a 4 crystal, fixed bandwidth, crystal filter while the KX1 has a 3 crystal, variable bandwidth crystal filter. The skirts on the PFR-3A's filter should be much sharper.

3. The PFR-3A has a 2 stage active audio filter peaked for a good CW receive frequency (700 Hz. or so) while the KX1 has no bandwidth filters other than the 3 crystal filter.

4. The KX1 and the PFR-3A both have a simple form of AGC. The PFR-3A reduces the signal by controlling the signal level right at the front end while the KX1 applies an AGC bias to pin 2 of the product detector chip. The chip manufacturer's data sheet says that no external bias should be applied to that pin. Why??? I do not know.

5. I found no differences in the transmitters that bothered me but the antenna tuners are a BIG difference. The KX1 has a very limited range automatic tuner that adds considerable cost while the PFR-3A's tuner is standard, very wide range, provides both balanced and unbalanced connections and has a very easy to use SWR indicator.

6. My impression, from reading the KX1's manual was that the software in the PFR-3A is easier to use. That is quite subjective and is probably a draw after you become familar with either.

Those were the reasons that I purchased the PFR-3A and a couple of months later purchasing the Weber Dual Bander to have basically the same radio, minus tuner, for 17M & 15M.

I hope this helps

1738. Receiver problems

Yahoo group: pfr3_group
Date: 2010-09-30 00:10:39 UTC
From: bwmiller262
Topic: 1738 Message: 1738

I recently finished putting my PFR-3 together. It was a lot of fun but I seem to be having problems receiving. Doing A/B testing with the same antenna--a 100' dipole at 30' tuned through a Palstar tuner--comparing my new PFR-3 and my trusty old IC-756 Pro II, I have found that a 577 signal on the Icom are barely discernable on the PFR-3. Anything weaker is completely lost to the PFR-3. A strong signal does comes through, but only a very strong one.

Any suggestions will be greatly appreciated.

Hi Bob,

A numb receiver could be caused by a number of things. To narrow down the problem:

Do you have the problem on all bands? Does the preselector reach a peak? How is the transmitter? Do you have proper p/out on all bands?

73.......Steve Smith WB6TNL

i dont like capacitive paddles either.
i dont believe the elecraft tuner has a very wide range
i read some reviews on eham and some of the operators are using mfj tuners
or the zdg autotuner.
my little emtech tuner is of similar design to the pfr3 tuner and will also match almost everything "dosent have a high / low impedance setting like the hendricks tuner hendricks has stand alone qrp tuners that are quite nice too.

From: Steven Weber
Topic: 1738 Message: 1741

99 out of 100 times poor receive sensitivity is due to having the input and output (link and secondary windings) of T1 misplaced. If you can't find a peak in signal strength using the Rx input tuning control, that is the problem.

The 1 out of 100 problem is shorted 2N7000 QSK transistors.

There are two ways to solve this (T1) problem.
1. make sure the winding are connected properly
2. Eliminate the link winding entirely. I have discovered that is possible to drive the ground end of the tuned secondary winding direct from the QSK switch and 51 ohm load resistor (which is now the ground return). So, you can eliminate the 5 turn link winding and connect the main winding across the two T1 pads which are not ground.

There might be a slight reduction in sensitivity doing it this way, but without a calibrated uV signal generator, you'll never notice it.

im assuming you are using the coax input so as to bypass the internal tuner?
do you get any output from the transmitter??
you might have a bad solder connection to one of the hand wound toroids.

Yes, I am using a coax input. Output seems good--about 4-5 watts on all bands. I've examined all the solder connections, including the toroids, with a magnifying glass and haven't been able to see any problems, but that doesn't mean it's not there. If you think one of the toroids may be the problem, I could redo them. Which one(s) would you look at?

Thanks,
Bruce

check the toroid windings using a low power ohmmeter
sometimes the solder joints to the magnet wire look good but the magnet wire wire wasnt wetted by the soldering process
"the ohms setting using your digital multimeter"
these windings will have very low resistance
under a couple of ohms.
did you clean or tin the magnet wire before soldering?
sometimes i cheat and solder through the magnet wire varnish but i use the ohmeter trick and raise my soldering temperature.
"im risking damaging the circuit board but im experienced in desoldering"

Steve: So I tried each of the T1 methods you recommended. Very little if any improvement. I did notice while testing the second scenario, however, that if I touch the top of C3 with my finger (which I first did accidentally while holding the board during testing), the sensitivity improves noticeably. Does that suggest anything?

A couple other notes:
* I currently have T1 set up with 40 windings, soldered into the two non-ground T1 holes on the board. There is nothing in the two ground holes of T1. My understanding was this was all that was required--is this correct?

* I've been using new #30 wire each time I've redone T1.

* I purchased my kit several years ago if that makes a difference (board is Rev A 2/9/08).

I'm sure that the problem is something I'm doing or missing. Sorry for the inconvenience.

Thanks again for your help,
Bruce, K7EY

Below is a list of issues that have come up by our builders.
also download the latest edition of the original pfr3 manual

a.. There are two caps marked C48 on board with different values. One is between the phone and paddle jack and the other is just below U9. Note that the cap between the phone and paddle jack should be C30 (.01 UFD)
b.. The color coding in the instructions for R6 and R7 are incorrect and should be orange orange yellow instead of red red orange.
c.. The 4.7pF cap may have been replaced by a green 5pF cap with a black dot. Either will work.
d.. Some of the electrolytic caps call for 16V parts. 25V parts may have been shipped, again either will work.
e.. In the section on the Low Pass Filters it calls for a 33 pfd cap to be installed. This should be a 22 pfd.
f.. In the Group 2 assembly, C26 .1 ufd should be installed with C25 and C28

Ordering Information

You may use our Order page to order the Portable Field Radio by mail using check or money order. or

Ordering electronically by PayPal using the buttons below.

NOTE
When an order is placed through PayPal, shipping charges are automatically calculated then a confirmation email is immediately sent by PayPal. For more information about our shipping charges please take a look at our Order Form page. We also receive this same email, so please rest assured that we have logged your order into our books. No other order confirmation will be issued. Your kit will be shipped in 1-2 weeks after our receiving the order, unless otherwise stated. Thanks for your support.

Orders of multiple kits that I can ship in the same box will have shipping costs adjusted and the excess will be refunded.

PFR3 Transceiver: $240.00

PFR3 Paddles: $40.00

View your PayPal cart:

Note: There is free shipping on the paddles when orderded with the PFR3

Please use our Order page to order by mail.

Subject: [pfr3_group] Re: Receiver problems

Steve: So I tried each of the T1 methods you recommended. Very little if any improvement. I did notice while testing the second scenario, however, that if I touch the top of C3 with my finger (which I first did accidentally while holding the board during testing), the sensitivity improves noticeably. Does that suggest anything?

A couple other notes:
* I currently have T1 set up with 40 windings, soldered into the two non-ground T1 holes on the board. There is nothing in the two ground holes of T1. My understanding was this was all that was required--is this correct?

* I've been using new #30 wire each time I've redone T1.

* I purchased my kit several years ago if that makes a difference (board is Rev A 2/9/08).

I'm sure that the problem is something I'm doing or missing. Sorry for the inconvenience.

Thanks again for your help,
Bruce, K7EY

Hi Bruce,

Here's how I would proceed:

Unsolder C3 at the end connected to T1. Connect a clip lead to C3 and to your antenna. Connect another clip lead from the other side of your antenna to PC board ground. Check the receiver. You may hear more than you expect because the low pass filter(s) and 1/2 of the preselector are out of circuit.

If it works, then C2,3,4 and L1 have been eliminated as the cause and the problem is likely in one of the components (or soldering) surrounding T1 (you have pretty well eliminated T1 as the cause).

If it doesn't work then the problem is 'down stream' of T1 (from C3 toward U1).

Have you checked Q2 for a short?

1753. Rotary encoder add-on kit

Yahoo group: pfr3_group
Date: 2010-10-04 01:15:08 UTC
From: Petr
Topic: 1753 Message: 1753

Hello folks,

I will be glad to know from all of You the opinion and experiences with rotary encoder kit using together with PFR-3. Regarding the scanning speed > I heard that somebody would like to have a bit faster scanning so it can be easily change in SW of course. Please let me know about Your opinion and needs in terms of improvement of the next batch of the rotary encoders.

As I got the information from Mirek diy4funatgmaildotcom he is still getting the orders so next batch (maybe last) is planed for next weeks.

If somebody still thinking about it then send the order to him in time...

BTW: any other tips for improving the encoder funtions please?

73 - Petr, OK1RP

i dont know why weber didnt incluse a rotary encoder option in his design
his dual bander tranceiver with a similar design includes a rotary encoder.

Hi,

probably simplicity, minimal size, weight, etc. were the
priorities for Steve instead of all-in one design. This
add-on kit just increasing the usability from bench I guess...

Steve, WB6TNL:

I followed your suggestion (i.e. unsoldered C3 at the end connected to T1...) and was then able to hear much better--almost as well as with my IC-756 Pro II, just not nearly as much gain. Therefore, as you indicated, the problem is likely one of the components or soldering surrounding T1. I've inspected the soldering again and can't see anything.

How would you suggest I proceed now?

Thanks again for your help.

Bruce, K7EY
